Abstract:

The Chicago Transit Authority (CTA), as project sponsor to the Federal Transit Administration (FTA), proposes to extend the existing Red Line heavy rail transit service 5.3 miles south from the existing 95th Street Terminal to 130th Street on Chicago's Far South Side. CTA proposes to cover a portion of the project funding by applying for federal funds administered by FTA. FTA and CTA prepared this Red Line Extension Project Environmental Impact Statement (EIS) in accordance with the National Environmental Policy Act of 1969 (NEPA) and other applicable regulations. This project is one part of CTA's Red Ahead Program, a comprehensive initiative for maintaining, modernizing, and expanding Chicago's most traveled rail line.

This Draft EIS looks at the benefits and impacts of implementing the NEPA Preferred Alternative—the Union Pacific Railroad Rail Alternative—on the physical, human, and natural environments along the corridor and near stations. This document considers two alignment (route) options for this alternative: the East Option and the West Option. This Draft EIS defines the options under consideration and evaluates the potential environmental, economic, and social impacts of the alternatives, specifically, impacts on transportation, land use and economic development, displacements and relocation of existing uses, neighborhoods and communities, visual and aesthetic conditions, noise and vibration, safety and security, historic and cultural resources, environmental justice, and other aspects of the environment. Potential mitigation measures are identified for adverse impacts resulting from operation or construction of the project. Financial implications of construction and operation of the proposed improvements are also disclosed. The information contained in this document will be used by FTA and CTA to decide whether to implement the project and to select an option for implementation.

Reviewers should provide their comments to CTA during the comment period of the Draft EIS. CTA will analyze and respond to comments and will use the information acquired in the preparation of the Final EIS. Comments on the Draft EIS should be specific and should address the adequacy of the statement and the merits of the alternatives discussed (40 Code of Federal Regulations § 1503.3).

FTA intends to issue a single document that consists of the Final EIS and Record of Decision pursuant to 23 United States Code § 139(n), unless it is determined that circumstances, such as changes to the proposed action, anticipated impacts, or other new information, preclude issuance of such a combined document.

Comments on this document must be submitted by 4:30 PM on November 30, 2016.

Send comments to the following address: Red Line Extension Project, Chicago Transit Authority, 567 W. Lake Street, 10th Floor, Chicago, IL 60661-1465; e-mail: RedExtension@transitchicago.com

Executive Summary

The Chicago Transit Authority (CTA), as project sponsor to the Federal Transit Administration (FTA), proposes to extend the existing Red Line heavy rail transit service 5.3 miles south from the existing 95th Street Terminal to Chicago's Far South Side. This project is one part of the Red Ahead Program to extend and enhance the entire Red Line.

The National Environmental Policy Act of 1969 (NEPA) mandates the consideration of environmental impacts before approval of any federally funded project that may have significant impacts on the environment or where impacts have not yet been determined (42 United States Code [USC] § 4332). FTA and CTA prepared this Red Line Extension (RLE) Project Draft Environmental Impact Statement (EIS) in accordance with NEPA and other applicable regulations.

Red Line Extension Project

The RLE Project would extend the Red Line from the existing 95th Street Terminal to 130th Street. The proposed 5.3-mile extension would include four new stations near 103rd Street, 111th Street, Michigan Avenue, and 130th Street. Each new station would include bus and parking facilities.

The RLE Project would reduce commute times for residents, improve mobility and accessibility, and provide connection to other transportation modes. The RLE Project could also foster economic development, where new stations may serve as catalysts for neighborhood revitalization and help reverse decades of disinvestment in local business districts. The RLE Project would also provide a modern, efficient car storage yard and shop facility. Supporting information on the purpose and need for this project is provided in **Chapter 1**.

Alternatives Considered

CTA undertook an extensive Alternatives Analysis process from 2006 to 2009 that considered multiple modes and corridor options for the RLE Project. The Chicago Transit Board designated the Union Pacific Railroad (UPRR) Rail Alternative as the Locally Preferred Alternative on August 12, 2009. Based on further technical analysis and public input, CTA selected the UPRR Rail Alternative as the NEPA Preferred Alternative in August 2014. This Draft EIS looks at the environmental benefits and impacts of the No Build Alternative and the two UPRR Rail Alternative options: the East Option and the West Option. Each alternative is described below.

No Build Alternative

The No Build Alternative is defined as the existing transportation system plus any committed transportation improvements that are already in the Chicago Metropolitan Agency for Planning Fiscal Year 2014–2019 Transportation Improvement Program, including improvements to the 95th Street Terminal. No new infrastructure would be built as part of the RLE Project under the No Build Alternative.

Union Pacific Railroad Rail Alternative - Locally Preferred Alternative

The proposed UPRR Rail Alternative would extend the heavy rail Red Line from the existing 95th Street Terminal to 130th Street. The UPRR Rail Alternative alignment would run south along I-94 from the 95th Street Terminal, then curve west along the north side of I-57 (within the I-57 right-of-way) for nearly ½ mile until reaching the UPRR corridor in the vicinity of Eggleston Avenue, as shown on **Figure ES-1**. The alignment would turn south to follow the UPRR corridor. Two options are being considered for the alignment along the UPRR corridor. The CTA elevated structure would be located either east or west of the existing UPRR corridor. The alignment would follow the UPRR corridor to Prairie Avenue, where it would cross over the Canadian National/Metra Electric District (CN/ME) tracks near 119th Street. South of this point, the East and West Options would follow the same alignment southeast along the Northern Indiana Commuter Transportation District/Chicago South Shore & South Bend Railroad (NICTD/CSS & SBRR) right-of-way using a portion of the Norfolk Southern Railway and Consolidated Rail Corporation rights-of-way to the terminus (end) of the RLE at 130th Street.

The UPRR Rail Alternative would include the following features:

- 5.3-mile heavy rail transit line extension from 95th Street Terminal to 130th Street
- Four new stations at 103rd Street, 111th Street, Michigan Avenue, and 130th Street
- New park & ride and bus facilities at each station with a total of 3,700 parking spaces along the corridor
- New yard and shop at 120th Street

As noted above, this Draft EIS studies two UPRR Rail Alternative options for the segment of the proposed alignment between I-57 and the CN/ME tracks near 119th Street:

- **East Option** - The CTA elevated structure would be placed immediately adjacent to the east side of the UPRR right-of-way.
- **West Option** - The CTA elevated structure would be placed immediately adjacent to the west side of the UPRR right-of-way.

Figure ES-1 shows the alignments for these options.

Environmental Benefits and Impacts

Potential environmental benefits and impacts are detailed in **Chapters 3–8** of the Draft EIS and are summarized in **Table ES-1**. The Draft EIS describes the best management practices (BMPs) and mitigation measures that would be employed to reduce impacts.

Table ES-1: Summary of Benefits and Impacts

<table>
<tr><th>No Build Alternative</th><th>Union Pacific Railroad Rail Alternative East Option</th><th>Union Pacific Railroad Rail Alternative West Option</th></tr>
<tr><td colspan="3">**Transportation** *(Chapter 3)*</td></tr>
<tr><td>No additional rapid rail transit service would be provided.

10 intersections would operate at level of service E/F in either the AM or PM peak hours or both in 2030. Traffic flow would continue to deteriorate.</td><td colspan="2">Permanent
Public Transportation
▪ CTA passengers would benefit from faster travel times by accessing rail service farther south.
▪ CTA passengers would benefit from reduced congested conditions at 95th Street Terminal with bus reroutes that would more directly connect passengers to new stations farther south.
▪ CTA passengers would benefit because of the new, direct rail service within the project area.
▪ CTA passengers would benefit from potential improved connections to regional commuter rail.
Vehicular Traffic
▪ Without mitigation, 15 intersections would operate at level of service E/F in either the AM or PM peak hours or both in 2030. Permanent impacts on vehicular traffic would not be adverse after mitigation.
Pedestrians
▪ Pedestrians would benefit from upgraded intersections immediately adjacent to stations with Americans with Disabilities Act (ADA)-accessible curb ramps and from replacement of deteriorated sidewalks.
▪ Due to the location of some park & ride facilities, passengers would need to cross an active UPRR track to reach stations, which would result in pedestrian safety impacts.
▪ Permanent impacts on pedestrians would not be adverse after mitigation.
Bicycles
▪ Bicyclists would benefit from the addition of bicycle parking at stations.
Freight Transportation
▪ No impacts
Parking Facilities
▪ No impacts. Benefits would accrue by providing additional park & ride opportunities to attract passengers to transit and potentially improve connections to regional commuter rail.
Construction
▪ Construction activities would temporarily affect the physical capacity of roadways and intersections subject to detours. For the city streets crossing the alignment, adjacent construction activities may require a lane closure. When performing work above the street (including beam placement), temporary detours will be required. Phasing the work will prevent simultaneous closure of adjacent city streets that cross the alignment. Work would be subject to Chicago Department of Transportation approval.
▪ Construction activities would require temporary lane closures on I-94 and I-57 as well as temporary shutdowns for all traffic. Temporary shutdowns of traffic (for overhead beam placement) would occur only at nighttime and during low-traffic-volume intervals and would be subject to Federal Highway Administration and Illinois Department of Transportation approval.
▪ Increased congestion due to construction may temporarily increase travel times along the I-94 and I-57 expressways.</td></tr>
</table>

No Build Alternative	Union Pacific Railroad Rail Alternative East Option	Union Pacific Railroad Rail Alternative West Option
	▪ Flagging operations and scheduled track closures would occur during construction activities near or adjacent to railroads. Scheduling would allow for continued freight and transit operations. ▪ Because of the temporary nature of construction activities, the use of construction best management practices, implementation of a traffic management plan, and implementation of the proposed mitigation measures, construction impacts from the UPRR Alternatives would not be adverse.	
Land Use and Economic Development *(Section 4.1)*		
No impacts	Permanent ▪ The park & ride facilities at the 103rd Street, 111th Street, and Michigan Avenue stations would be inconsistent with adjacent land uses and zoning designations. ▪ The substation just north of Michigan Avenue would be inconsistent with the adjacent land uses. ▪ Land use impacts would not be adverse after mitigation. ▪ The East Option could spur economic revitalization and the development of more livable, transit-supportive communities near the proposed stations. Construction ▪ Construction jobs could create short-term economic benefits. ▪ Construction could be disruptive to businesses along the alignment. Construction impacts would not be adverse after mitigation.	Permanent ▪ The elevated track structure in Fernwood Parkway would alter the open space's function as a buffer between the UPRR freight tracks and the single-family neighborhood on the west side of Eggleston Avenue. ▪ The park & ride facilities at the 103rd Street, 111th Street, and Michigan Avenue stations would be inconsistent with adjacent land uses and zoning designations. ▪ The substation just north of Michigan Avenue would be inconsistent with the adjacent land uses. ▪ Land use impacts would not be adverse after mitigation. ▪ The West Option could spur economic revitalization and the development of more livable, transit-supportive communities near the proposed stations. Construction ▪ Construction jobs could create short-term economic benefits. ▪ Construction could be disruptive to businesses along the alignment. Construction impacts would not be adverse after mitigation.
Displacements and Relocation of Existing Uses *(Section 4.2)*		
No impacts	Permanent ▪ 260 parcels (106 buildings) would be acquired for the East Option to accommodate the tracks, stations, 120th Street yard and shop, and ancillary facilities. Most of the displacements would be spread evenly along the corridor between 99th Place and the Michigan Avenue station. ▪ Permanent impacts would not be adverse after mitigation. Construction ▪ No impacts	Permanent ▪ 205 parcels (46 buildings) would be acquired for the West Option to accommodate the tracks, stations, 120th Street yard and shop, and ancillary facilities. Displacements would be spread evenly along the corridor between 103rd Street and the Michigan Avenue station. ▪ Permanent impacts would not be adverse after mitigation. Construction ▪ No impacts

No Build Alternative	Union Pacific Railroad Rail Alternative East Option	Union Pacific Railroad Rail Alternative West Option
Neighborhoods and Communities *(Section 4.3)*		
No impacts	Permanent *Community Character and Cohesion* ▪ The track structure would encroach on the edges of neighborhoods by displacing residential buildings. This impact would not be adverse after mitigation. ▪ The elevated track structure would create an adverse visual impact north of I-57 and at the intersection of 117th Street and Prairie Avenue. These impacts would remain adverse despite mitigation. ▪ The noise from CTA trains would cause adverse impacts at noise-sensitive buildings. This impact would not be adverse after mitigation.	Permanent *Community Character and Cohesion* ▪ The track structure would encroach on the edges of neighborhoods by displacing residential buildings. This impact would not be adverse after mitigation. ▪ The elevated track structure would create an adverse visual impact north of I-57 and between 99th and 103rd Streets, including 103rd Street station. This impact would remain adverse despite mitigation. ▪ The Michigan Avenue station park & ride facility would create an adverse visual impact. This impact would remain adverse despite mitigation. ▪ The noise from CTA trains would cause adverse impacts at noise-sensitive buildings. These impacts would not be adverse after mitigation.
	Mobility ▪ Passengers would benefit from improved mobility with reduced travel times.	*Mobility* ▪ Passengers would benefit from improved mobility with reduced travel times.
	Community Resources ▪ The East Option would displace the Now Faith Church of God Holiness and would cross portions of Wendell Smith Park and Block Park. These impacts would not be adverse after mitigation. ▪ Passengers would benefit from increased access to community resources in the project area.	*Community Resources* ▪ The West Option would displace the Grace Temple Church of God Established in Christ and would run through Fernwood Parkway. These impacts would not be adverse after mitigation. ▪ The elevated structure would be near Wendell Smith Park. This impact would not be adverse after mitigation. ▪ Passengers would benefit from increased access to community resources in the project area.
	Construction *Community Character and Cohesion* ▪ Construction would introduce temporary, intermittent visual, noise, and dust impacts. ▪ Construction impacts would not be adverse after mitigation.	Construction *Community Character and Cohesion* ▪ Construction would introduce temporary, intermittent visual, noise, and dust impacts. ▪ Construction impacts would not be adverse after mitigation.
	Mobility ▪ Construction would cause truck traffic to increase, and temporary street closures and detours would be needed. ▪ Access to businesses could be temporarily limited on an intermittent basis. ▪ Construction impacts would not be adverse after mitigation.	*Mobility* ▪ Construction would cause truck traffic to increase, and temporary street closures and detours would be needed. ▪ Access to businesses could be temporarily limited on an intermittent basis. ▪ Construction impacts would not be adverse after mitigation.

No Build Alternative	Union Pacific Railroad Rail Alternative East Option	Union Pacific Railroad Rail Alternative West Option
	Community Resources ▪ Construction activities would be required in Wendell Smith Park and Block Park. ▪ Access to community resources near the construction areas may be temporarily disrupted by street closures and detours. ▪ Construction impacts would not be adverse after mitigation.	*Community Resources* ▪ Construction activities would be required in Wendell Smith Park and Fernwood Parkway. ▪ Access to community resources near the construction areas may be temporarily disrupted by street closures and detours. ▪ Construction impacts would not be adverse after mitigation.
Visual and Aesthetic Conditions *(Section 4.4)*		
No impacts	Permanent ▪ The elevated track structure would create an adverse visual impact north of I-57 and at the intersection of 117th Street and Prairie Avenue. These impacts would remain adverse despite mitigation. Construction ▪ Construction would create temporary adverse impacts due to the construction work zone. ▪ Construction impacts would not be adverse after mitigation.	Permanent ▪ The elevated track structure would create an adverse visual impact north of I-57 and between 99th and 103rd Streets, including 103rd Street station. ▪ The Michigan Avenue station park & ride facility would create an adverse visual impact. ▪ Visual impacts would remain adverse despite mitigation. Construction ▪ Construction would create temporary adverse impacts due to the construction work zone. ▪ Construction impacts would not be adverse after mitigation.
Noise and Vibration *(Section 4.5)*		
No impacts	Permanent ▪ There could be moderate noise impacts on 574 noise-sensitive receivers and severe noise impacts on 83 noise-sensitive receivers before mitigation. There would be no severe or moderate impacts after mitigation. ▪ No permanent vibration impacts. Construction ▪ Construction noise levels would not exceed the FTA-recommended construction noise limits. ▪ No construction-related vibration impacts.	Permanent ▪ There could be moderate noise impacts on 738 noise-sensitive receivers and severe noise impacts on 49 noise-sensitive receivers before mitigation. There would be no severe or moderate impacts after mitigation. ▪ No permanent vibration impacts. Construction ▪ Construction noise levels would not exceed the FTA-recommended construction noise limits. ▪ No construction-related vibration impacts.
Safety and Security *(Section 4.6)*		
No impacts	Permanent ▪ A large number of pedestrians would be expected to cross the major streets without positive traffic control (marked crosswalks or signalized intersections with pedestrian countdowns), which would be an adverse impact on pedestrian safety. ▪ Permanent safety impacts would not be adverse after mitigation. ▪ There would be no permanent security impacts. Construction ▪ There would be no construction-related safety or security impacts after mitigation.	

No Build Alternative	Union Pacific Railroad Rail Alternative East Option	Union Pacific Railroad Rail Alternative West Option
Historic and Cultural Resources *(Section 4.7)*		
No effects	▪ There would be a No Adverse Effect finding on one resource - the Roseland Pumping Station.	▪ No effects on any resources
Hazardous Materials *(Section 4.8)*		
No impacts	Permanent ▪ CTA identified six High Concern sites within the permanent envelope of the East Option and six High Concern sites within the permanent envelope of the West Option. ▪ Benefits could result from the cleanup and/or removal of contaminated material during construction. ▪ Daily operations or maintenance activities that require earthmoving in contaminated areas could result in impacts from accidental spills or releases. ▪ Hazardous material spills or releases that occur along the NICTD/CSS & SBRR railroads would have the potential to migrate and affect the project area. ▪ Permanent impacts would not be adverse after BMPs and standard practices are implemented. Construction ▪ There would be the potential to encounter hazardous materials during construction. ▪ Construction-related impacts would not be adverse after BMPs and standard practices are implemented.	
Wetlands *(Section 4.9)*		
No impacts	Permanent ▪ The East and West Options could affect approximately 15.34 acres of wetlands in the vicinity of the 120th Street yard and shop and the 130th Street station. ▪ Impacts on wetlands would be mitigated through compensatory mitigation, if required. ▪ Coordination with the U.S. Army Corps of Engineers is ongoing. Construction ▪ Construction staging areas would be sited outside of wetlands as much as possible, but if there were any temporary impacts, those areas would be restored as wetlands after construction. ▪ Impacts on wetlands would be mitigated through compensatory mitigation, if required.	
Indirect and Cumulative *(Chapter 5)*		
No impacts	Indirect ▪ Implementation of the East or West Option would have the potential for redevelopment from new employment accessibility, attraction of new development near RLE stations, and overall livability improvements. Cumulative ▪ The surrounding communities would benefit from the cumulative impacts of other planned and programmed projects in the project area because they would improve access to jobs, places of interest, and residences, and would result in a reduction of air emissions.	
Resources with Limited or No Adverse Impacts *(Chapter 6)*		
The No Build Alternative and the UPRR Rail Alternative East and West Options would have limited or no impacts on the following resource areas: air quality, water quality, floodplains, vegetation and wildlife habitat, threatened and endangered species, geology and soils, and energy.		

No Build Alternative	Union Pacific Railroad Rail Alternative East Option	Union Pacific Railroad Rail Alternative West Option
Environmental Justice *(Chapter 7)*		
No impacts	▪ Permanent impacts on community character and permanent visual impacts would not be appreciably more severe or greater in magnitude than similar effects elsewhere in CTA's rail system. ▪ There would be no disproportionately high or adverse impacts on minority or low-income populations.	
Section 4(f) *(Chapter 8)*		
No impacts	▪ No adverse impacts on the attributes, features, or activities of Wendell Smith Park and Block Park would result from the East Option after the proposed mitigation; therefore, FTA has made a preliminary *de minimis* finding for both parks, subject to further public input as part of the Draft EIS.	▪ No adverse impacts on the attributes, features, or activities of Fernwood Parkway would result from the West Option after the proposed mitigation; therefore, FTA has made a preliminary *de minimis* finding for this park, subject to further public input as part of the Draft EIS.

After implementation of the BMPs and mitigation measures described in the Draft EIS, adverse impacts on community character and cohesion and on visual and aesthetic conditions would remain for both the East and West Options.

Evaluation of Alternatives

CTA used the following evaluation goals and criteria, based on the purpose and need, to compare the benefits and drawbacks of the East and West Options:

- Goal 1 - Reduce Transit Times
- Goal 2 - Increase Travel Choices
- Goal 3 - Increase Economic Competitiveness
- Goal 4 - Minimize Environmental Impacts
- Goal 5 - Provide the Best Value

Table ES-2 provides specific measures for the goals listed above, and compares the extent to which the East and West Options and the No Build Alternative would meet the goals.

Table ES-2: Comparative Evaluation of Alternatives

Criteria	No Build Alternative	Union Pacific Railroad Rail Alternative East Option	Union Pacific Railroad Rail Alternative West Option
Goal 1 - Reduce Transit Times			
Travel Times Between Stations[1,2]			
130th Street to 95th Street Terminal	28 minutes	14 minutes	14 minutes
130th Street to Jackson Station (Loop)	58 minutes	39 minutes	39 minutes
Would the proposed stations serve transit-dependent communities?	No	Yes	Yes
Would there be new direct service to Altgeld Gardens?	No	Yes	Yes
Goal 2 - Increase Travel Choices			
Would there be better access to regional employment centers and local commercial areas?	No	Yes	Yes
Would potential connections to other public transportation modes within the project area be possible?	No	Yes	Yes
Would geographic isolation be reduced?	No	Yes	Yes
How many stations would have Park & Ride Facilities?	0	4 of 4	4 of 4
Total Park & Ride Spaces	0	3,700	3,700
Goal 3 - Increase Economic Competitiveness			
Could nearby development be encouraged?	No	Yes	Yes
Goal 4 - Minimize Environmental Impacts			
Displacements and Relocations			
Properties	0	260	205
Buildings	0	106	46
Residential Buildings	0	90	26
Mixed-Use Buildings	0	1	2
Commercial and Industrial Buildings	0	13	17
Places of Worship	0	1	1
City-Owned Buildings	0	1	0
Noise Impacts After Mitigation	No change	Not adverse	Not adverse
Receivers with Moderate Impacts (before mitigation/after mitigation)	0	574/0	738/0
Receivers with Severe Impacts (before mitigation/after mitigation)	0	83/0	49/0
Park Impacts (Not Adverse After Mitigation)[3]			
Construction Phase	0 parks	2 parks	2 parks
Permanent	0 parks	2 parks	1 park
Permanent (acres)	0 acres	1.6 acres	1.9 acres
Would there be community character impacts after mitigation?	No	Yes	Yes
Would there be visual and aesthetic impacts after mitigation?	No	Yes	Yes
Goal 5 - Provide the Best Value			
Projected Ridership (per weekday)	0	42,000	42,000
Capital Costs[4]	$0	$2.26 Billion	$2.30 Billion
Annual Change in O&M Costs[5]	No Change	+$17.4 Million	+$17.4 Million

Public Input Requested

This Draft EIS serves as the primary document to facilitate public and agency review of the proposed project. CTA has established a 45-day comment period to take formal comments on the Draft EIS. The Draft EIS is available on the CTA website (www.transitchicago.com/RedEIS), and hard copies of the Draft EIS are available at the following locations during the public review period:

- CTA headquarters, 567 W. Lake Street, 2nd Floor, Chicago, IL 60661
- Pullman Public Library, 11001 S. Indiana Avenue, Chicago, IL 60628
- West Pullman Public Library, 830 W. 119th Street, Chicago, IL 60643
- Altgeld Public Library, 13281 S. Corliss Avenue, Chicago, IL 60827
- Woodson Regional Public Library, 9525 S. Halsted Street, Chicago, IL 60628
- Calumet Park Public Library, 1500 W. 127th Street, Calumet Park, IL 60827
- Harold Washington Library Center, 400 S. State Street, Chicago, IL 60605

A public hearing is scheduled for November 1, 2016 from 5:30 to 7:30 PM at St. John Missionary Baptist Church (211 E. 115th Street, Chicago, IL 60628) to solicit comments from the community about findings presented in the Draft EIS. The location of the public hearing is ADA-compliant and accessible by public transit. Comments received during the public hearing will be submitted to FTA and will be entered into the public record. A summary of the public hearing will be included in the Final EIS. Written comments will also be accepted at any time during the public comment period via e-mail to: RedExtension@transitchicago.com and U.S. mail to: Chicago Transit Authority, Strategic Planning, 10th Floor, Attn: Red Line Extension Project, 567 W. Lake Street, Chicago, IL 60661.

Chapter 1
Purpose and Need

The Chicago Transit Authority (CTA), as project sponsor to the Federal Transit Administration (FTA), proposes to extend the Red Line heavy rail transit (HRT) service 5.3 miles south from the existing 95th Street Terminal to Chicago's Far South Side. The Chicago Transit Board designated the Union Pacific Railroad (UPRR) Rail Alternative, discussed further in **Chapter 2**, as the Locally Preferred Alternative (LPA) on August 12, 2009. Based on further technical analysis and public input, CTA selected the UPRR Rail Alternative as the National Environmental Policy Act of 1969 (NEPA) Preferred Alternative in August 2014. CTA proposes to cover a portion of the project funding by applying for federal funds administered by FTA. The Red Line Extension (RLE) Project is included in the list of fiscally constrained projects in the Fiscal Year (FY) 2014–2019 Transportation Improvement Program (TIP) of the Chicago Metropolitan Agency for Planning (CMAP) *GO TO 2040 Comprehensive Regional Plan* (*GO TO 2040*).

NEPA mandates the consideration of environmental impacts before approval of any federally funded project that may have significant impacts on the environment or where impacts have not yet been determined. FTA and CTA prepared this RLE Project Draft Environmental Impact Statement (EIS) in accordance with NEPA and other applicable regulations, including Section 106 of the National Historic Preservation Act (NHPA), Section 4(f) of the United States Department of Transportation (USDOT) Act of 1966, joint guidance and regulations from FTA and the Federal Highway Administration (FHWA), and other agency regulations and guidelines.

When the RLE Project began in 2006 it was compliant with the federal transportation funding and authorization bill: Section 6002 Safe, Accountable, Flexible, Efficient Transportation Equity Act: A Legacy for Users (SAFETEA-LU). In 2012 a new transportation funding and authorization bill was passed into law—the Moving Ahead for Progress in the 21st Century Act, also known as MAP-21. In December 2015, the Fixing America's Surface Transportation (FAST) Act was signed into law. The RLE Project is compliant with SAFETEA-LU, MAP-21, and the FAST Act.

This Draft EIS looks at the benefits and impacts of implementing the No Build Alternative and the NEPA Preferred Alternative—the UPRR Rail Alternative—on the physical, human, and natural environments along the corridor and near stations. This document considers two alignment (route) options within the NEPA Preferred Alternative: the East Option and the West Option. While this document refers to the "East and West Options" for brevity, only one of the two options would be selected and implemented (not both).

This chapter describes the purpose and need for transit improvements within the project area. This purpose and need was developed from the purpose and need statement presented in the RLE Alternatives Analysis (AA) document (**Appendix A**), input received from the public during the EIS scoping process (**Appendix B**), ongoing public outreach (summarized in **Chapter 10** and **Appendix C** of this Draft EIS), and the *Red Line Extension Livability Report* (by CMAP, CTA, and Developing Communities Project, Inc. [DCP]). This chapter also describes CTA's basis for advancing the RLE Project, identifies objectives that frame the development and evaluation of the alternatives, and sets the stage for NEPA analysis leading to the agency's final decision on the project. Additional background data supporting this statement of purpose and need is provided in the *Purpose and Need Report* (**Appendix D**).

1.1 Project Area Overview and Background

CTA's Red Ahead Program is a comprehensive initiative for maintaining, modernizing, and expanding Chicago's most-traveled rail line, the Red Line. As part of the program, FTA and CTA have been analyzing the proposed extension of the Red Line (see **Figure 1-1**).

Figure 1-1: Red Ahead Program Overview

The project area for the RLE is approximately 11 miles south of the Loop (Chicago's central business district) on Chicago's Far South Side. The project area encompasses approximately 20 square miles. The boundaries of the project area are 95th Street on the north, Ashland Avenue on the west, Stony Island Avenue on the east, and the Calumet-Sag Channel/Little Calumet River and 134th Street on the south (**Figure 1-2**). The project area includes expressways, regional arterials, commuter and freight railroads, intermodal connectors, local streets, bicycle facilities, and pedestrian facilities. The expressways that pass through the project area are Interstate 94 (I-94, also known as the Dan Ryan Expressway north of 95th Street and the Bishop Ford Freeway south of 95th Street) and Interstate 57 (I-57). From the northern border of the project area, I-94 runs south to 99th Street, curves east, then curves south and runs along the west side of Lake Calumet. I-57 joins I-94 at 95th Street and runs east of the Metra Rock Island District commuter rail line to 115th Street, and then curves south along the western limit of the project area.

CTA's Red Line HRT service currently terminates at the 95th Street Terminal, in the northern portion of the project area. From there, a network of CTA and Pace Suburban Bus Service (Pace) bus routes serves the surrounding Far South Side communities. The 95th Street Terminal is among CTA's busiest stations, and many residents in the project area use bus service to transfer to the Red Line, causing lengthy travel times. The Red Line operates 24 hours per day, 7 days per week, as do some of the connecting bus routes.

Metra operates commuter rail in the project area. The commuter rail lines include the Rock Island District, Electric District mainline, and Electric District Blue Island branch. The Northern Indiana Commuter Transportation District (NICTD) operates the South Shore Line, which shares tracks with the Metra Electric District (ME) mainline north of 115th Street. These commuter rail lines offer primarily peak-hour, peak-direction service to and from downtown Chicago, with infrequent service outside of peak hours.

The overall project area has residential (primarily single-family), commercial (urban mixed-use), industrial, transportation, utility, and vacant land uses. Commercial land uses are clustered around the major thoroughfares in the area, including Michigan Avenue and Halsted Street. Vacant properties are interspersed throughout most residential and commercial blocks. The project area encompasses parts of nine community areas in the City of Chicago and the eastern section of the Village of Calumet Park (see **Figure 1-2**). Chicago community areas include Beverly, Washington Heights, Roseland, Morgan Park, Pullman, West Pullman, Riverdale, Hegewisch, and South Deering. The project area also contains several schools, universities (including Chicago State University), and the Altgeld Gardens public housing project. According to census data, project area population and employment have declined during the past decade (U.S. Census Bureau 2010); however, CMAP anticipates growth in some areas by 2030 (CMAP 2010b).

1.2 Statement of Purpose and Need

This Draft EIS builds upon the RLE AA process, which took place from 2006 through 2009. The AA process included public involvement and conceptual design and analysis to identify the project's purpose and need. The purpose and need reflects the project objectives discussed with the public during the AA process, EIS scoping (including the public scoping meetings), and ongoing public involvement activities. This Draft EIS discusses the extent to which the alternatives in **Chapter 2** meet the purpose and need, which are tied to the goals discussed in **Section 9.2**.

1.2.1 Purpose

The purpose of the RLE Project is as follows:

- Reduce commute times for residents both within and south of the project area.
- Improve mobility and accessibility for transit-dependent residents in the project area.
- Improve rapid transit rail service to isolated areas and provide viable linkages between affordable housing (e.g., the Altgeld Gardens public housing project), jobs, services, and educational opportunities, thereby enhancing livability and neighborhood vitality.
- Provide an opportunity for potential connections and linkages to other public transportation modes including regional commuter rail in the project area.
- Foster economic development in the project area, where new stations may serve as catalysts for neighborhood revitalization and help reverse decades of disinvestment in local business districts.
- Provide a modern, efficient rail car storage yard and shop facility to provide storage and cost-effective preventive maintenance for rail cars associated with the RLE Project, rail cars currently stored in the existing 98th Street Yard and Shop, and rail cars supporting additional Red Line expansion of service.

1.2.2 Need

The need for the RLE Project is demonstrated by the following existing conditions:

- Transit trips to jobs are longer for Far South Side residents than they are for residents in the Chicago seven-county region[1] as a whole.
- Transit-dependent populations in the project area have limited direct access to rapid transit rail service.
- The project area is geographically isolated from major activity centers and provides residents limited viable transportation options, which limits access between affordable housing (e.g.,

---

[1] The Chicago seven-county region includes the counties of Cook, DuPage, Kane, Kendall, Lake, McHenry, and Will.

the Altgeld Gardens public housing project) and employment centers outside of the project area.

- Existing transit markets are underserved and transit connectivity is challenging in the project area.
- Disinvestment and limited economic development in the project area have negatively affected Far South Side communities.
- The existing 98th Street Yard does not have capacity to store rail cars for any substantial increase in Red Line capacity accompanying future Red Line expansion.

1.3 Justification of Purpose and Need

This section documents the elements of the purpose and need for the RLE Project as identified in **Section 1.2**. Supporting data is summarized in the following sections, and more detailed supporting data is available in the *Purpose and Need Report* (**Appendix D**).

1.3.1 Long Transit Trips to Job Centers for Far South Side Residents

Project area commute times are among the longest in the city, as shown in the map inset on **Figure 1-3**. **Figure 1-3** details commute times in the project area. During 2005–2010, commute times were 24 percent longer for project area residents than for other residents in the seven-county region—approximately 39 minutes one-way for project area residents, versus 32 minutes region-wide (U.S. Census Bureau 2010). Expressway and arterial traffic congestion limit the mobility of residents in the project area, including bus passengers who are frequently stuck on the same congested roadways. *GO TO 2040* states the "region's congestion levels are among the highest in the nation, and projected increases in population, jobs, and freight traffic will only add to the pressure on our infrastructure" (CMAP 2010b). Traffic congestion in the Chicago metropolitan area has steadily increased in recent decades, and project area roadways are approaching capacity limits during the morning peak period.

Public transit passengers and those who depend on public transit for meeting their travel needs are hardest affected by these long commute times. Complex transfers to reach the 95th Street Terminal make commute times greater than 2 hours one-way for some project area residents (CMAP 2012a). Project area residents accessing the 95th Street Terminal by bus and other transportation modes experience measureable delays resulting from congestion along arterial streets. The need for improved access to job centers outside of the project area is evidenced by an unemployment rate of 19 percent in the project area (U.S. Census Bureau 2013). Some neighborhoods within the project area, such as Riverdale, have unemployment rates as high as 34 percent (U.S. Census Bureau 2013). The RLE Project would reduce transit travel times to jobs from many neighborhoods in the project area, which would help facilitate job access and result in additional viable employment opportunities.

Figure 1-3: Travel Time to Work

1.3.2 Transit-Dependent Populations Lack Direct Access to Rapid Transit Rail Service

A large share of the population in the project area falls within several demographic categories that typically indicate transit dependency: low-income populations, senior citizens, people who are too young to drive, people with disabilities, and people living in households without cars. For transit-dependent populations, the availability of quality transit service that connects them to job centers is particularly important. The following comparisons highlight the transit-dependent characteristics of the project area:

- The median annual household income in the project area is approximately $41,000, which is below the Chicago metropolitan area median of approximately $62,000 (U.S. Census Bureau 2010). Some community areas, such as Riverdale, have median annual household incomes as low as $11,000. The entire Chicago metropolitan area had a decline in median household income of approximately 7 percent between 2000 and 2010, but these effects have been more pronounced in the project area, which had a decline of nearly 21 percent in the same timeframe (U.S. Census Bureau 2010). Low-income households are less likely to own cars, and frequently rely on transit as their primary mode of transportation.

- Approximately 15.3 percent of project area residents are over the age of 65, compared to 10.3 percent of the Chicago metropolitan area (U.S. Census Bureau 2010). Senior citizens are more likely to be transit dependent because they may no longer be physically able to drive.

- Approximately 27 percent of the project area is under the age of 18, compared to 23 percent of the Chicago metropolitan area (U.S. Census Bureau 2010). Minors are more likely to be transit dependent because many are too young to obtain driver's licenses, or do not have the financial means to purchase a car.

- Approximately 15.4 percent of households in the project area have at least one member with a disability, compared to 11 percent region-wide (U.S. Census Bureau 2010). People with disabilities are more likely to be transit dependent if their disabilities prevent them from driving a car.

- Although the average household size in the project area (2.88 persons per household) is nearly the same as in the Chicago metropolitan area (2.84 persons), project area households have fewer vehicles on average (U.S. Census Bureau 2010). Approximately 10 percent of project area households have no vehicle available, versus 6 percent region-wide. Of the project area households that do have cars, there are generally fewer cars per person than other households in the region, causing some household members to rely on non-automobile modes of transportation.

The CTA Red Line currently serves only the northernmost portion of the project area directly. Most residents in the project area must use connecting bus service to reach the 95th Street Terminal, which results in long travel times, as described in **Section 1.3.1**. Direct access to rapid transit from a greater share of project area residences would improve job access.

1.3.3 Isolation from Major Activity Centers and Limited Viable Transportation Options

Despite the substantial amount of roadway infrastructure in the project area, expressways and arterial streets frequently become congested, thereby limiting mobility. Mobility is further inhibited by the limited options for connecting to the CTA's rail system. Although bus routes operated by CTA and Pace provide service 24 hours a day, buses in the project area are frequently delayed by congestion on arterial streets leading to the 95th Street Terminal. None of the Red Line stations along the Dan Ryan branch currently have park & ride facilities, precluding residents from accessing the stations by car unless they are dropped off. Several bus routes serve the 95th Street Terminal and Metra stations; however, the large residential tracts surrounded by local streets limit the bus network.

While the project area does have an extensive sidewalk and crosswalk system along the road network, physical divisions between communities include the ME mainline, which is on an embankment; Lake Calumet; the Little Calumet River; the UPRR right-of-way, which extends north-south from 99th Street to 119th Street; and large tracts of industrial land. These physical divisions are difficult to cross for pedestrians and bicyclists, and effectively separate the communities on either side. This geographic isolation is particularly problematic for residents of the Altgeld Gardens public housing project at the south end of the project area between 130th Street and 134th Street in the Riverdale community area. Residents in this area have limited employment opportunities and transportation choices within walking distance of their homes.

There is a high percentage of vacant homes in the project area—13 percent higher than the City of Chicago (CMAP 2012a). Several factors contribute to housing vacancy rates in a particular community. These factors include, but are not limited to, safety and security, proximity to public services, access to jobs, quality of schools, age and type of available housing units, quality of life, and the overall health of the community. In addition, there are ten affordable housing properties (with a total of almost 2,800 units) within ½ mile of the proposed alignment (National Housing Preservation Database 2015). Improved public transportation options, combined with affordable housing stock, would serve as a catalyst to bring people to the area that would not otherwise consider communities in the project area as a viable place to live. Mutual benefit for project area residents, and those seeking affordable housing, could be provided through rapid transit south of the 95th Street Terminal.

1.3.4 Underserved Transit Markets and Limited Transit Connectivity

Several groups of potential passengers ("transit markets") in the project area are underserved by the existing transit system. Transit service enhancements, including those proposed as part of the RLE Project, would improve service for these groups. The largest underserved groups are as follows:

- Project area residents who must use connecting bus routes to reach the Red Line - Most of the CTA and Pace bus routes in the project area serve the Red Line's 95th Street Terminal. As discussed above, average travel times for work trips and the number of transit-dependent residents are higher in the project area (compared to the seven-county region) due to traffic congestion and the time required to ride a bus to the 95th Terminal and transfer to the CTA

Red Line. The combination of these conditions underscores the need to improve connectivity and provide faster transit service.

- People driving to Chicago activity centers from the project area and points south - There are currently no CTA parking facilities on the Red Line Dan Ryan branch, leaving motorists coming from the project area and points south few options for parking at a Red Line station and completing their trips via transit. In addition, I-94 is congested northbound in the AM peak period and southbound in the PM peak period; during these time periods, traffic flows are more than 15 miles per hour slower than free flow speeds of 60 miles per hour (Illinois Department of Transportation [IDOT] 2015). CTA park & ride facilities near major expressways or arterial streets in the southern portions of the project area would provide new, convenient access possibilities on the Red Line. The need for park & ride facilities was confirmed based on travel demand modeling performed in 2009, as part of the RLE AA process (see **Appendix A**).

- Transit passengers traveling to other potential transit destinations - This group includes those taking reverse commute trips (residents in the central areas of the city commuting to jobs in outer communities), school trips, and trips entirely within the project area. There are several educational facilities in the project area, including Chicago State University (7,200 students), Olive-Harvey College (4,300 students), and several high schools (including Harlan, Corliss, Fenger, Julian, Brooks, and Carver High Schools) that would benefit from transit improvements in the project area.

1.3.5 Disinvestment and Limited Economic Development Have Affected Far South Side Communities

The project area has experienced ongoing disinvestment, including loss of manufacturing jobs, which has led to a decline in population, services, and job opportunities. Once-vibrant retail districts, such as Michigan Avenue and Halsted Street, now contain vacant land and storefronts. This decline is evidenced by the decrease in project area population and employment compared to the City of Chicago and the seven-county region (**Table 1-1** and **Table 1-2**).

Table 1-1: Population Decline in Red Line Extension Project Area (2000 to 2010)

Area	2000 Population	2010 Population	Change
Chicago Seven-County Region	8,146,264	8,399,893	3.0%
City of Chicago	2,895,964	2,700,741	-7.2%
Red Line Extension Project Area	147,662	128,366	-15.0%

Source: U.S. Census Bureau 2010

Table 1-2: Employment Decline in Red Line Extension Project Area (2000 to 2010)

Area	2000 Employment	2010 Employment	Change
Chicago Seven-County Area	4,083,530	4,429,414	8.5%
City of Chicago	1,358,054	1,410,294	3.8%
Red Line Extension Project Area	62,587	56,105	-11.5%

Source: U.S. Census Bureau 2010

The City of Chicago is focused on stabilizing, improving, and redeveloping communities in and around the project area. As a result, the City has designated several tax increment financing (TIF) districts, redevelopment areas, special service areas, and industrial corridors in the project area (see **Appendix D** for more information). In addition to economic revitalization initiatives, viable transportation options continue to be a key element in the success of economic development efforts and revitalization for communities within the project area. Examples of redevelopment in the project area include the Pullman District, the Method factory, and a new Walmart store (opened 2014). The Pullman District includes the Pullman factory, the Hotel Florence, and the Pullman Railroad Porters National Museum. This district was named a National Monument on February 19, 2015, making it a component of the National Park System. Building on the Pullman's community history as a manufacturing hub, Method, a manufacturer of environmentally friendly cleaning and personal care products, opened a new 150,000-square-foot factory in Pullman in April 2015, which has created approximately 100 jobs.

1.3.6 The Need for a Rail Car Storage Yard and Maintenance Facility

The existing 98th Street Yard does not have capacity to store rail cars required for any substantial increase in Red Line capacity accompanying future Red Line expansion. Two yard and shop facilities (Howard Yard at the north end of the Red Line and 98th Street Yard at the south end of the Red Line) provide storage for vehicles operating along the Red Line. Any Red Line expansion must consider the capacity of both yards. The Howard Yard and the 98th Street Yard together supply rail cars for both the northern and southern portion of the Red Line. Both yards are necessary to efficiently provide trains to meet the current and future operating plans for the entire Red Line. All northbound trains currently begin their run at 98th Street Yard, and any expansion of Red Line service would require expanded yard capacity at or near the southern end of the Red Line. The existing 98th Street Yard is landlocked between interstate ramps for I-94 and I-57. There is no room to expand the yard without major realignments of the two highways. In addition, the existing 98th Street Yard is oriented as a terminal yard for service to and north of the 95th Street Terminal. With the RLE Project expanding service to the south, use of the 98th Street Yard would lead to inefficient operations. Moving trains into and out of the existing yard, due to the orientation of the yard, would cause operational inefficiencies and potential capacity constraints to Red Line service.

1.4 Organization of the Document

This Draft EIS analyzes how well the NEPA Preferred Alternative would satisfy the purpose and need stated above. It also analyzes the potential impacts of the No Build and NEPA Preferred Alternatives. **Section 9.2** provides further analysis of the extent to which the East and West Options would satisfy the purpose and need.

NEPA documents, such as this EIS, must provide sufficient technical detail to meet a range of legal requirements and are required to be organized in a specific way, as described in 40 Code of Federal Regulations (CFR) § 1502. **Figure 1-4** provides an overview of the chapters and the major topics covered in this document.

CHAPTER 1 **Purpose and Need**	This chapter is the foundation of the document. It introduces the project, provides background information, and explains why the project is proposed and important.
CHAPTER 2 **Alternatives Considered**	This chapter reviews the planning process and alternatives considered in developing the project and describes the alternatives under further consideration in this Draft Environmental Impact Statement.
CHAPTER 3 **Transportation**	This chapter presents the potential for impacts on the transportation network. This chapter also discusses measures to avoid or minimize those impacts.
CHAPTER 4 **Environmental Impacts and Mitigation**	This chapter discusses the social, economic, and environmental resources that could be affected by the construction and operation of the project alternatives. This chapter also discusses measures to avoid or minimize those impacts.
CHAPTER 5 **Resources with Limited or No Adverse Impacts**	This chapter summarizes the resources that would have limited or no adverse impacts due to operation or construction of the project alternatives.
CHAPTER 6 **Environmental Justice**	This chapter discusses the impacts of the project alternatives on environmental justice communities in the project area.
CHAPTER 7 **Section 4(f) Evaluation**	This chapter focuses on meeting the federal requirements of Section 4(f) of the U.S. Department of Transportation Act of 1966, which protects significant historic sites, publicly owned parks, recreation areas, wildlife refuges, and waterfowl refuges that could be used by a federally funded project.
CHAPTER 8 **Evaluation of Alternatives**	This chapter presents potential capital and operations funding strategies as well as a summary evaluation of the project alternatives.
CHAPTER 9 **Public and Agency Coordination**	This chapter discusses the processes for public involvement and agency coordination and addresses public comments and suggestions.
Chapter 10 **List of Acronyms and Abbreviations**	This chapter provides definitions for the acronyms and abbreviations used within the document.
CHAPTER 11 **List of References**	This chapter provides the references used within the document.
CHAPTER 12 **List of Preparers**	This chapter lists the preparers of this document.
CHAPTER 13 **List of Recipients**	This chapter lists the agencies, local officials, and public libraries that were notified of the availability of this document.

Figure 1-4: Environmental Impact Statement Document Organization

Chapter 2
Alternatives Considered

This chapter describes the alternatives studied in this Draft EIS and discusses how they were developed. It also includes documentation of alternatives that were analyzed and subsequently eliminated from further consideration.

2.1 Alternatives Development Process

CTA began developing the alternatives studied in this Draft EIS during the AA, which took place during 2006–2009. Starting with multiple modes and corridor options, CTA developed and screened alternatives through a combination of conceptual engineering, public input (open house and stakeholder meetings), and preliminary analysis of potential impacts and costs. A three-level, detailed screening process was used to evaluate the alternatives and identify an LPA. **Appendix A** (LPA Report) provides detailed documentation of the Screen 1, Screen 2, and Screen 3 evaluations.

The Screen 1 evaluation began by identifying the universe of alternatives, which included a wide range of transit modes (such as bus, rail, or streetcar), project area corridors, and profiles (where the transit line is in relation to the ground). Combinations of 11 modes, 9 corridors, and 4 profiles were evaluated against the purpose and need. Based on this evaluation, the following alternatives were carried forward for further analysis in Screen 2: two bus rapid transit (BRT) alternatives along Halsted Street and Michigan Avenue; six HRT alternatives along Halsted Street, the UPRR, and Michigan Avenue; the No Build Alternative; and a "low cost" alternative (formerly required for FTA analyses known as the Transportation System Management [TSM] Alternative).

The alternatives carried through to the Screen 2 evaluation were more thoroughly defined to include mapping of a more defined alignment, identification of potential station locations, and preliminary service plans. Station spacing was determined by the type of alternative proposed, project area needs, and consistency with the purpose and need. The eight evaluation factors for the Screen 2 included a mix of qualitative and quantitative factors intended to further evaluate the performance of each alternative with respect to the project goals and objectives. Specific evaluation factors included physical constraints; right-of-way requirements; social and economic factors; demographics and employment; environmental factors; noise, visual, natural, and cultural resource impacts; transportation factors; and travel time, transit connectivity, and traffic.

Based on the results of the Screen 2 evaluation, a BRT alternative along Halsted Street (operating on dedicated lanes), two HRT alternatives along Halsted Street and the UPRR, the No Build Alternative, and the TSM Alternative were recommended for further evaluation in Screen 3. In addition to the alternatives carried forward from the Screen 2 evaluation and based on discussions with FTA, CTA combined the TSM Alternative with a BRT alternative (operating on existing right-of-way rather than dedicated lanes as proposed in Screen 2) along Michigan Avenue to form a single alternative (called the BRT Alternative) for evaluation in Screen 3. Because the Michigan Avenue BRT Alternative would operate in the existing right-of-way, it would require fewer property acquisitions than BRT on dedicated lanes. Screen 3 was a two-step evaluation process that included the further definition and refinement of alternatives, including conceptual design and the evaluation of these alternatives. Nine evaluation factors were used to evaluate the alternatives as part of Screen 3, including physical constraints, public support, social and economic factors, environmental factors, transportation factors, capital cost comparison, operating and maintenance cost comparison, ridership potential, and FTA's Cost Effectiveness Index. The result of the Screen 3 evaluation was a recommendation for the LPA: the UPRR Rail Alternative.

Based on the results of the AA and considerable public support for the corridor, including a 2004 referendum where 38,000 residents in the 9th and 34th Wards supported the UPRR corridor for the RLE Project, the UPRR Rail Alternative was recommended as the LPA, indicating that it is the alternative that would best meet the purpose and need of the project while addressing potential impacts and other potential constraints. The UPRR Rail Alternative would provide access to the most densely populated portions of the study area, which are primarily residential and transit supportive. The Chicago Transit Board designated the UPRR Rail Alternative as the LPA on August 12, 2009. **Figure 2-1** summarizes the AA process.

[1] The Chicago Transit Board designated the UPRR Rail Alternative as the Locally Preferred Alternative on August 12, 2009.

[2] This Draft EIS presents impacts of the No Build Alternative and two options of the UPRR Rail Alternative: the East Option and the West Option.

EIS = Environmental Impact Statement, UPRR = Union Pacific Railroad

Figure 2-1: Alternatives Development Summary

After the AA, CTA further refined the alternatives for presentation during the NEPA scoping process and study in this Draft EIS. At the conclusion of the AA process, the UPRR Rail Alternative was anticipated to be located adjacent to the east or west edge of the UPRR right-of-way. In 2012, CTA learned of a Chicago Department of Transportation (CDOT) feasibility study looking at moving UPRR freight operations out of the existing UPRR corridor before the RLE Project. By moving UPRR freight operations out of the existing UPRR corridor, CTA could use the existing UPRR right-of-way for the RLE Project. CTA evaluated this new option of the UPRR Rail Alternative, known as the Right-of-Way Option, in preparation of this Draft EIS. Subsequent coordination between local agencies and the railroads indicated that relocating UPRR freight operations from this corridor presents considerable challenges and would not be feasible.

During 2012–2014, CTA evaluated benefits and impacts of four alternatives: the No Build Alternative, the BRT Alternative (along Michigan Avenue), the UPRR Rail Alternative, and the Halsted Alternative. CTA evaluated three options for the UPRR Rail Alternative: the Right-of-Way Option, East Option, and West Option. CTA also evaluated two options for the UPRR Rail Alternative 130th Street station: a South Station Option and a West Station Option. **Appendix E**, *Description of Alternatives*, contains details about each of these four alternatives and both options for the 130th Street station. The supporting technical memoranda, included in this Draft EIS as **Appendices H–X**, include analysis of each of these alternatives and options.

In August 2014, based on the technical analysis and public input until then, CTA announced the NEPA Preferred Alternative—the UPRR Rail Alternative. Because the Right-of-Way Option is not feasible, the Draft EIS evaluates only the East and West Options for the UPRR Rail Alternative. CTA has chosen to move forward with the South Station Option at 130th Street based on technical analysis and public feedback. **Section 2.4** contains additional information about the BRT Alternative, UPRR Right-of-Way Option, UPRR West Station Option for the 130th Street station, and Halsted Alternative in the discussion of alternatives considered but not pursued.

2.2 Alternatives Evaluated in the Draft Environmental Impact Statement

This Draft EIS discusses the No Build Alternative and two options of the UPRR Rail Alternative: the East Option and the West Option. **Figure 2-2** shows the UPRR Rail Alternative alignments. For simplicity, this alternative is called the "UPRR Alternative" in the remaining sections of this document and the UPRR Rail Alternative East and West Options are referred to as the "East and West Options." **Appendix F** contains plans and profiles for the East and West Options.

2.2.1 No Build Alternative

The No Build Alternative is a required alternative as part of the NEPA environmental analysis and is used for comparison purposes to assess the relative benefits and impacts of implementing the UPRR Alternative.

The No Build Alternative represents future conditions if the UPRR Alternative were not implemented. The No Build Alternative includes all projects currently included in the fiscally constrained portion of the CMAP FY 2014–2019 TIP. Projects in the TIP in the project area include renovation of the 95th Street Terminal, rail line maintenance and improvements, preservation of the North Pullman historic area, road resurfacing, coordination of traffic signal timing, and construction of a new bicycle/pedestrian facility. Impacts related to the construction and operation of the 95th Street Terminal are documented in the approved *95th Street Terminal Improvement Project Environmental Assessment* (CTA 2013b). FTA issued a Finding of No Significant Impact for the 95th Street Terminal Improvement Project in April 2013 and an Amended Finding of No Significant Impact in July 2013. An Environmental Assessment Re-Evaluation performed by FTA in July 2016 confirmed that the Amended Finding of No Significant Impact dated July 2013 remains valid. No new infrastructure would be built as part of the RLE Project under the No Build Alternative.

2.2.2 Union Pacific Railroad Alternative

The UPRR Alternative would extend the heavy rail Red Line 5.3 miles from the existing 95th Street Terminal to 130th Street. As noted above, the Chicago Transit Board designated the UPRR Alternative as the LPA at its August 12, 2009 board meeting. The UPRR Alternative would reduce transit travel times from the project area to points on the Red Line north of 95th Street (from 130th Street to 95th Street) from 28 minutes to approximately 14 minutes (CTA 2009, see **Appendix D**). Two alignment options adjacent to the UPRR are considered for this alternative: the East Option and the West Option.

Alignment

The UPRR Alternative alignment would run south along I-94 from the 95th Street Terminal, then curve west along the north side of I-57 (within the I-57 right-of-way) for nearly ½ mile until reaching the UPRR corridor in the vicinity of Eggleston Avenue, as shown on **Figure 2-2**. The alignment would turn south to follow the UPRR corridor. Two options are being considered for the alignment along the UPRR corridor. The CTA elevated structure would be located either east or west of the existing UPRR corridor. The alignment would follow the UPRR corridor to Prairie Avenue, where it would cross over the Canadian National/Metra Electric District (CN/ME) tracks near 119th Street. South of this point, the East and West Options would follow the same alignment southeast along the NICTD/Chicago South Shore & South Bend Railroad (NICTD/CSS & SBRR) right-of-way using a portion of the Norfolk Southern Railway and Consolidated Rail Corporation (Conrail) right-of-way to the terminus (end) of the RLE at 130th Street.

As described, two UPRR Alternative options for the segment of the proposed alignment between I-57 and the CN/ME tracks near 119th Street are studied in this Draft EIS:

- East Option - The CTA elevated structure would be placed immediately adjacent to the east side of the UPRR right-of-way.

- West Option - The CTA elevated structure would be placed immediately adjacent to the west side of the UPRR right-of-way.

Structure and Tracks

In the UPRR Alternative, the tracks would be on a new elevated (aerial) track structure from the 95th Street Terminal through the CN/ME track crossing near 119th Street. South of this elevated crossing, the tracks would transition to an at-grade profile (they would continue at ground level).

The proposed elevated structure would be a closed-deck, steel and concrete, aerial track structure with direct-fixation track and welded rail (welded at joints). With direct-fixation track, rails are mounted to specially designed concrete blocks fixed to the concrete deck. Noise barriers (approximately 4 feet in height, measured from the top surface of the concrete deck) are proposed for portions of the structure on both sides of the track deck to reduce noise transmission at and below track level. The structure would vary in height from 14 feet 9 inches to 40 feet above existing grade, depending on required clearances above existing roadways and railroads. The two tracks would have a spacing of 13 feet (13 feet between the track centerlines). The elevated deck, on which the tracks would run, would vary in width from approximately 30 feet to approximately 52 feet at stations.

Figure 2-3 is a photo simulation of a typical proposed elevated structure above the UPRR right-of-way. The design shown is conceptual, and the actual design would vary based on further engineering and community input.

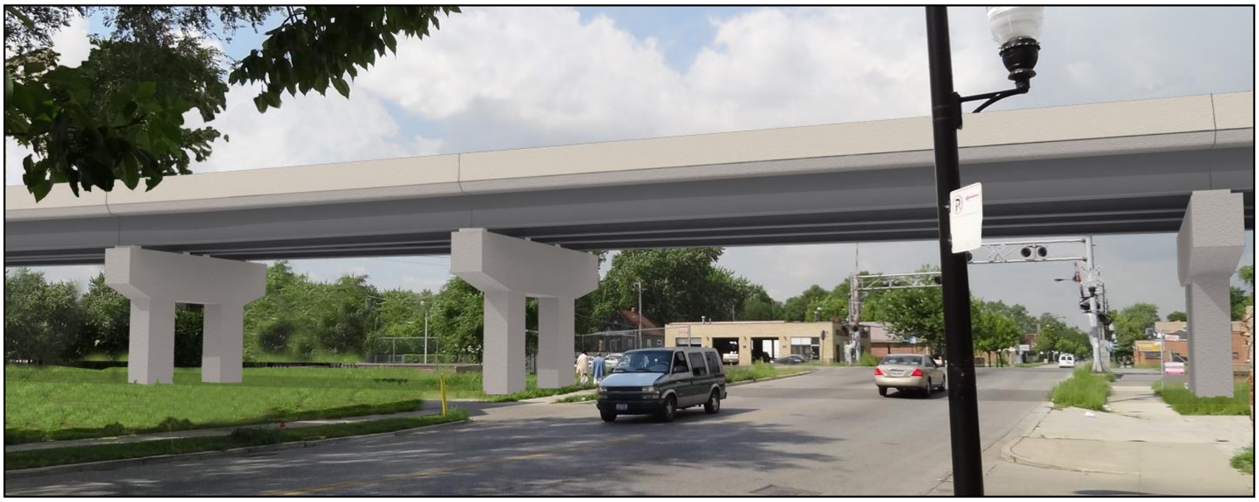

Figure 2-3: Photo Simulation of Union Pacific Railroad Alternative East Option at 111th Street Facing West - Typical Proposed Elevated Structure

Stations

As part of either the East or West Option, four new stations would be constructed at the following locations along the proposed alignment:

- 103rd Street (elevated station)
- 111th Street (elevated station)

- Michigan Avenue (elevated station)
- 130th Street (at-grade station)

At 103rd Street, 111th Street, and Michigan Avenue, East Option stations would be located east of the UPRR tracks, and West Option stations would be located west of the UPRR tracks. Each station would have a center platform, approximately 26 feet wide and 520 feet long. Platforms would accommodate ten-car trains. Each station would be Americans with Disabilities Act (ADA) accessible with elevators. Each station area would include areas for bus boarding, new crosswalks where needed to accommodate pedestrian traffic, and park & ride facilities. **Figure 2-4** is a photo simulation of a typical proposed station. The design shown is conceptual, and the actual design would vary based on further engineering and community input.

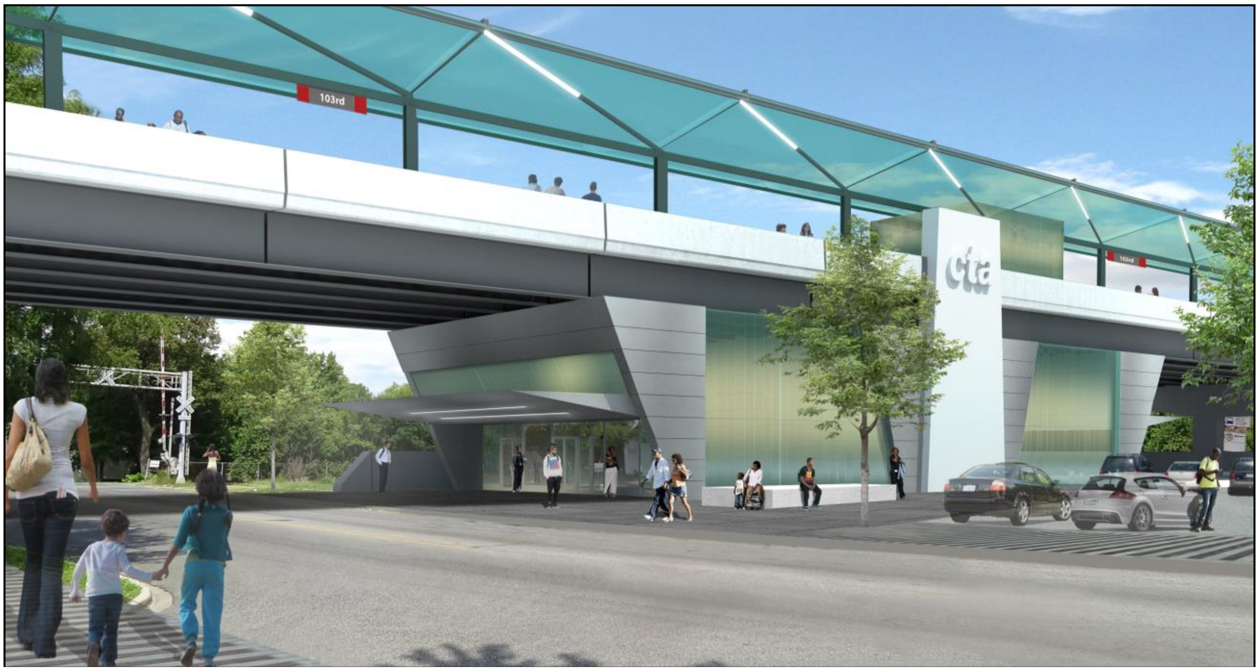

Figure 2-4: Photo Simulation of Union Pacific Railroad Alternative East Option at 103rd Street Facing Northwest - Typical Proposed Elevated Station

The 130th Street station would be located immediately west of the NICTD/CSS & SBRR right-of-way at 130th Street. Pedestrians from Altgeld Gardens would access the station from 130th Place. Pedestrians would not need to cross 130th Street to access the station because 130th Street goes over 130th Place and the railroad tracks.

Park & Ride Facilities

To accommodate passengers arriving at either the East or West Option stations by car, park & ride facilities would be constructed near each station. **Table 2-1** lists the park & ride locations, number of parking spaces at each location, and the proposed parking facilities for both the East and West Options. A total of 3,700 parking spaces would be available along the corridor. CTA estimated parking demand based on travel demand modeling performed in 2009. Bus turnarounds would be provided in the parking areas. The ground floor of the parking structure at the Michigan Avenue station would contain space for retail and community facilities.

Table 2-1: Summary of Park & Ride Facilities

Station	Number of Parking Spaces	Union Pacific Railroad Alternative East Option	Union Pacific Railroad Alternative West Option
103rd Street	200	Divided between two surface parking lots (one on the east side of the tracks and one on the west side of the tracks)	One surface parking lot
111th Street	200	Divided between two surface parking lots (one on the east side of the tracks and one on the west side of the tracks)	One surface parking lot
Michigan Avenue	1,000	Divided between a three-story parking structure and a surface parking lot (a surface parking lot on the east of the tracks and a parking structure on the west of the tracks)	Five-story parking structure
130th Street	2,300	Seven-story parking structure	

Yard and Shop

The 120th Street yard and shop, with a capacity of 340 train cars, would be sited on a combination of industrial and vacant land east of the CN/ME tracks and west of the NICTD/CSS & SBRR tracks near 120th Street and Cottage Grove Avenue. The yard would be entirely at grade. Parking spaces for CTA employees would be included at the yard. The existing 98th Street Yard and Shop at the south end of the existing Red Line would be used for other purposes, such as non-revenue equipment repairs once the 120th Street yard and shop is constructed. The yard could also function as a location where trains could be turned back from south to north for irregular or emergency service.

Substations

Substations are buildings along the alignment that house equipment to regulate the flow of electricity to the third rail, which supplies power to the trains. Substations would be placed approximately 0.8 to 1 mile apart along the alignment. Six new and upgraded substation locations are proposed: 98th Street Yard and Shop, near 101st Street, near 107th Street, near Lafayette Avenue, within the 120th Street yard and shop area, and near the 130th Street station. CTA would confirm the need and location for substations during future design phases.

Operating Plan

The UPRR Alternative would operate 24 hours a day, each day of the year. Service frequency is anticipated to be the same as with the current service (April 2016) at 95th Street—approximately 6-minute headways during morning peak hours and approximately 3-minute headways during afternoon peak hours. Headways at night (between 1 AM and 4 AM) would be approximately 13–15 minutes. Service frequency would be adjusted to accommodate demand once the RLE service has been implemented. Train frequencies would vary throughout the day (like existing Red Line service), and late night service would operate approximately every 15 minutes. Based on the estimated running time for the RLE, an additional 78 rail cars would be required as part of this project. The additional 78 rail cars would include 64 rail cars to meet the peak period schedule, plus 14 spare rail cars. Train sets would be eight cars long. Stations and track alignment would accommodate ten-car trains to maintain the option of running ten-car trains in the future. With the extension of the Red Line, some existing bus routes would be rerouted to feed into the proposed stations.

2.3 Summary of Construction Activities

This section summarizes the construction that would be needed for the UPRR Alternative. The *Description of Construction and Phasing for Build Alternatives* (**Appendix G**) provides additional details. Final engineering and pre-construction activities (see **Section 2.3.3**) would occur during 2018–2021. Heavy construction work would occur during 2022–2025, which would include 1 year of testing. The tentative opening year for the RLE is 2026. The construction timeline is dependent on federal reviews and federal, state, and local funding.

2.3.1 Construction Segments and Phasing

Construction activities would be grouped by type of work and location. Overall schedule and coordination of all construction segments would be phased and scheduled to maintain CTA operations at the 95th Street Terminal and 98th Street Yard and Shop and vehicular traffic on affected expressways and roadways.

For the purposes of describing construction activities, the RLE corridor would be divided into seven segments. **Figure 2-5** shows proposed construction segments. **Table 2-2** describes work activities for each construction segment. The construction segments and phasing plans described here are based on conceptual engineering completed to date and provide the greatest amount of flexibility for future design within a maximum envelope for evaluating environmental impacts. It is anticipated that construction of the RLE Project would be completed from north to south; however, future design phases may determine a different sequencing of construction activities.

Figure 2-5: Construction Segments

Table 2-2: Construction Segments and Summary of Work Activities

Segment	Location	Work Activities
U-1	From the 95th Street Terminal to the beginning of the horizontal curve at the UPRR crossing	▪ Install trackwork and signals to tie into the 95th Street Terminal. Possibly relocate trackwork between the 95th Street Terminal and the 98th Street Yard and Shop. ▪ Construct approximately 500 feet of retained fill structure south of 95th Street Terminal. ▪ Construct single-track, elevated structures over existing CTA tracks leading to the 98th Street Yard and Shop and over the existing CTA/southbound I-94 tunnel. ▪ Construct the dual-track, elevated structure through the I-94/I-57 interchange, across the westbound I-57 entrance ramp from southbound I-94, and north of the southbound I-57 lane. ▪ Upgrade the substation currently serving the 98th Street Yard and Shop.
U-2	The horizontal curve at the UPRR crossing	▪ Construct the dual-track, elevated structure spanning both lanes of I-57.
U-3	From the end of the horizontal curve at the UPRR crossing to the CN/ME track crossing near 119th Street	▪ Demolish existing buildings and structures in the proposed right-of-way where necessary. ▪ Construct the dual-track, elevated structure along the UPRR corridor. ▪ Construct stations at 103rd Street, 111th Street, and Michigan Avenue. ▪ Construct parking lots/structures and bus turnarounds at stations. ▪ Construct three substations. ▪ East Option only - Relocate the Block Park communications tower.
U-4	From the CN/ME track crossing near 119th Street to the at-grade track	▪ Demolish existing buildings and structures in the proposed right-of-way where necessary. ▪ Construct the dual-track, elevated structure along the UPRR corridor and over the CN/ME tracks near 119th Street. ▪ Construct the 120th Street yard and shop track tie-in. ▪ Construct retained embankment structure to carry the elevated structure to grade. ▪ West Option only - Construct the dual-track, elevated structure along and across the UPRR corridor and Prairie Avenue.
U-5	From the end of the aerial structure crossing the CN/ME tracks near 119th Street to the lead tracks into the 130th Street station (which would begin near the south end of the proposed yard)	▪ Construct the track roadbed. ▪ Construct the MWRD access road and bridge over the RLE tracks and the NICTD/CSS & SBRR crossing.
U-6	130th Street station (including lead tracks)	▪ Construct the track roadbed. ▪ Construct the 130th Street station. ▪ Construct the parking structure for the 130th Street station. ▪ Construct bus bays and road access for the 130th Street station. ▪ Construct the MWRD access road to 130th Street. ▪ Construct the substation.
U-7	120th Street yard and shop	▪ Construct the yard and track. ▪ Construct the shop building. ▪ Construct the access road and CTA employee parking. ▪ Construct the substation.

UPRR = Union Pacific Railroad, CTA = Chicago Transit Authority, CN/ME = Canadian National/Metra Electric District, MWRD = Metropolitan Water Reclamation District of Greater Chicago, RLE = Red Line Extension, NICTD/CSS & SBRR = Northern Indiana Commuter Transportation District/Chicago South Shore & South Bend Railroad

2.3.2 Construction Staging

Construction staging areas provide space to store equipment and materials, load trucks, and have workers perform parts of the construction process. Construction staging areas would be within the proposed right-of-way or within property acquired for stations, park & ride facilities, and the yard and shop. Nearby vacant properties and parking lots may also be used through the establishment of temporary construction easements. Staging and item assembly would be performed off-street to the fullest extent possible, to minimize traffic and community disruption. Along I-57, temporary construction easements on the expressway may be required, requiring shoulder and lane closures as well as temporary shutdown of traffic. Temporary construction easements on Metropolitan Water Reclamation District of Greater Chicago (MWRD) property near the yard and shop may be required as well.

Construction vehicles would access the staging areas on a regular basis, and would require special hauling routes and queuing locations to deliver materials and equipment, as well as remove debris. These special routes may require temporary lane closures or reconfigurations. Hauling routes would be designed to minimize impacts on noise- and dust-sensitive areas, such as residential neighborhoods, to the extent feasible. Specific design of each construction staging area would be determined during future design phases.

2.3.3 Pre-Construction Activities

Pre-construction activities would include development of construction schedules, quality plans, and procurement schedules. Utility protection and relocation information would be coordinated and verified in advance of the early construction activities. CTA and the construction contractor would initiate community notifications as early as possible to provide opportunities for community input and preparation. Demolition and building permits would be obtained during pre-construction as well. Construction mitigation measures, such as fencing, would be put in place in advance of commencing major construction activities. Materials requiring mitigation, such as asbestos, lead paint, and contaminated soil, would be identified and addressed before the start of demolition and excavation activities. The proposed UPRR alignment is in a residential area with homes, parks, schools, and businesses. Construction activities would be evaluated such that the local dynamics of the area and the needs of the property owners and businesses, as well as the end users, are incorporated into the project.

2.3.4 Traffic Rerouting

During construction, auto traffic, pedestrians, and buses may need to be rerouted around the construction sites. Rerouting of traffic is normally done by using detours and complete street closures. Street closures may include main streets, side streets, alleys, and driveways. Temporary traffic lanes and driveways would be used as needed to provide alternate access. The following activities would occur as part of traffic rerouting:

- Placement of construction signage and temporary traffic barriers
- Temporary reduction in the number of available lanes or complete street closures
- Conversion of two-way streets to one-way operation on a temporary basis

- Implementation of detours around lane and street closures
- Provision of temporary traffic lanes
- Provision of special access points for construction vehicles traveling to and from construction staging areas and the proposed rail right-of-way
- Implementation of sidewalk detours and temporary parking restrictions
- Temporary partial closure of the 95th Street Terminal and tracks leading to the 98th Street Yard and Shop, with provision of alternate bus service

Specific maintenance of traffic measures for each affected roadway and for each construction phase would be determined in a traffic management plan. The traffic management plan would be developed in the design phase of this project and would be reviewed by the agency or agencies with jurisdiction over the affected roadways.

2.3.5 Demolition

Construction of either the East or West Option would require building demolition. The demolition process would temporarily result in increased noise and debris. Work would be performed in accordance with local ordinances for construction activities. Pedestrian and vehicular traffic would not be allowed into demolition areas. The demolition process may include concrete removal, use of jackhammers, excavation, and removal of foundations. Materials requiring disposal would be stored in construction staging areas, loaded into dump trucks, and moved off-site. All materials would be handled and disposed of in a proper manner, in accordance with applicable federal, state, and local regulations.

2.3.6 Elevated Structures and Track Placement

Foundations for elevated structures and parking garages can consist of concrete and steel footings or drilled concrete shafts, depending on site conditions. A geotechnical engineer would perform exploratory borings during future design phases to determine soil type, soil capacity, and physical obstructions. The soil would be sampled to determine whether contaminants are likely to be present in the soil. All types of foundations would require excavation and removal of soil from the construction area via truck. Materials shipped off-site for disposal would be handled through approved facilities. Large cranes would be used to guide piles into position, and impact pile-driving may be needed. As described in later sections, impact pile-driving would be avoided in the vicinity of the historic Roseland Pumping Station.

After placement of foundations for the elevated structures, reinforced cast-in-place concrete piers would be constructed. The superstructure would consist of steel or concrete girders with a concrete deck to support the tracks. Along at-grade segments, tracks would be placed on ballast and ties after grading and soil preparation.

2.3.7 Earth Retention Structures

Two general categories of earth structures may be used on this project. The first is earth embankment, which consists of compacted earth with slopes on either side of the tracks. Typically, the slopes would include vegetation. Fencing for security would also be included. Earth embankments are appropriate in areas without right-of-way constraints, such as east of the CN/ME track crossing near 119th Street. The second category of earth structures is earth retained between concrete walls. These walls may use cast-in-place concrete or precast concrete panels. Retained embankments are appropriate in areas where additional right-of-way acquisition would cause additional impacts.

2.3.8 Temporary Shoring

During excavation, temporary shoring may be required to facilitate construction and protect adjacent structures. Shoring would consist of steel sheet piling driven into the ground. Temporary shoring for excavations may also include h-piles and lagging, cofferdams, and trench boxes. Temporary shoring of elevated structures may include temporary columns, footings, and shoring towers. Elevated structural work may include temporary protective barriers, fencing, barricades, and containments. The rig for the vibratory pile driver may be located within the construction staging areas, the permanent right-of-way for the project, or the street right-of-way depending on the space limitations and access points.

2.4 Alternatives Considered but not Pursued

During development of the project, CTA fully evaluated the BRT Alternative, the Right-of-Way Option for the UPRR Alternative, and the Halsted Rail Alternative (Halsted Alternative). In addition, CTA fully evaluated a West Station Option for the 130th Street station. These alternatives and the station option were analyzed as part of the technical memoranda preparation for the Draft EIS, but are not included in this Draft EIS. They were eliminated from analysis based on public input, technical constraints, potential impacts, and the extent to which they did not meet the project's purpose and need.

CTA also evaluated a variation of the UPRR Alternative where the tracks would be at grade rather than elevated, described in **Section 2.4.2**.

2.4.1 Bus Rapid Transit Alternative

CTA considered a BRT Alternative along Michigan Avenue between 95th Street Terminal and Altgeld Gardens. This limited-stop enhanced bus route along the existing #34 South Michigan Avenue bus route would have transit signal priority along Michigan Avenue. The alternative included four stops, each with park & ride facilities. Although the BRT Alternative was a lower-cost alternative than the UPRR Alternative, it was eliminated in August 2014 based on public feedback including the following concerns:

- The BRT Alternative would have minimal travel time improvements compared to the No Build Alternative (23 minutes from 130th Street to 95th Street under the BRT Alternative, compared to 28 minutes for existing conditions [CTA 2009] or 14 minutes for the UPRR Alternative over the same distance).
- Approximately 1 million riders per year were anticipated for the BRT Alternative—in comparison to 13 million riders per year anticipated for the UPRR Alternative (CTA 2009).

- The BRT buses would not have traveled on a dedicated lane along Michigan Avenue because of limited right-of-way. Although transit signal priority was planned, additional travel time savings would not have been realized without dedicated lanes for BRT buses.

2.4.2 Union Pacific Railroad Alternative

This Draft EIS summarizes the benefits and impacts of the East and West Options. In preparation of the Draft EIS, CTA fully evaluated the Right-of-Way Option and the 130th Street Station West Station Option. CTA also considered an at-grade (rather than elevated) track structure for the UPRR Alternative. Engineering memos, included with the plans and profiles in **Appendix F**, provide additional details on the at-grade evaluation of the UPRR Alternative.

Right-of-Way Option

As part of the UPRR Right-of-Way Option, the elevated CTA structure would have been placed in the UPRR right-of-way. This option was added in 2012 in response to the CDOT feasibility study looking at moving UPRR freight operations out of the existing UPRR corridor before the RLE Project. The Right-of-Way Option would only be feasible if the separate project were implemented before implementation of the RLE Project. Coordination between local agencies and the railroads indicted that relocation of UPRR freight operations from this corridor presents considerable challenges; therefore, this option is no longer feasible. Estimated travel times and ridership were the same for the Right-of-Way Option as for the East and West Options. Because the elevated CTA structure would have been placed in the UPRR right-of-way, the Right-of-Way Option would have resulted in fewer displaced properties than either the East or West Option.

130th Street Station - West Station Option

CTA initially considered two options for the 130th Street station: a South Station Option and a West Station Option. The South Station Option (described as part of the Build Alternative in **Section 2.2.2**) would be located immediately west of the NICTD/CSS & SBRR right-of-way at 130th Street. The West Station Option would be located along the north side of 130th Street at Evans Avenue. Pedestrians from Altgeld Gardens would access the West Station Option through a pedestrian crosswalk on 130th Street. A traffic signal would be required at this intersection to allow pedestrians to safely cross 130th Street.

The South Station Option is supported by the community and the Chicago Housing Authority because it would be more accessible from Altgeld Gardens. The West Station Option would incur additional costs because it would require approximately 1,100 feet of additional track due to its location, and would require intersection improvements to allow pedestrians to safely cross the street. The South Station Option would provide the best opportunity for a future connection to NICTD, improving regional rail connections and linkages to other modes of public transportation. Based on public feedback and technical analysis, CTA is considering only the South Station Option for 130th Street station.

At-Grade Track Structure

CTA considered a variation of the UPRR Alternative in which the RLE tracks would run at grade along the UPRR rail corridor (between I-57 and Prairie Avenue). In this variation, the existing east-west roadways would run either above or below the new at-grade CTA tracks and the existing at-grade UPRR tracks. Like the proposed UPRR Alternative, this variation would be elevated from the 95th Street Terminal to south of I-57, then at grade from I-57 to Prairie Avenue, elevated to cross the CN/ME tracks near 119th Street, then at grade near the proposed yard and shop and 130th Street station. CTA evaluated potential impacts and cost implications to run the east-west roadways both above (using overpasses) and below (using underpasses) the at-grade UPRR tracks and the proposed at-grade CTA tracks.

Roadway Overpasses

For an at-grade track structure, one option would be to use overpasses to carry roadways over the tracks. If roadway overpasses were used, they would need to be constructed at eight locations. More than 100 properties (primarily residential homes) would be displaced due to the overpass footprint, elimination of access to existing alleyways or driveways, and proximity of the embankment structure to the residential homes. The overpass structure and associated embankment could be as high as 30 feet, creating a substantial visual impact on the adjacent one-story residential buildings. In addition, permanent north-south residential street closures would be required where the streets would intersect with the embankment, which would disrupt neighborhood connectivity. Utilities that currently run within the street rights-of-way would have to be relocated. The potential construction cost savings between the elevated track structure and the at-grade structure would be insignificant when the cost of additional right-of-way acquisition and utility relocations is included. Roadway overpasses would also increase community impacts.

Roadway Underpasses

A second option for an at-grade track structure would be to use underpasses to carry roadways under the tracks. If underpasses were used, they would need to be constructed at eight locations. The underpass variation would have property displacements and community impacts similar to those of the roadway overpass option except a large retaining wall would be located in front of the residential homes. Because the cost of a roadway underpass structure may be as much as double the cost of an overpass structure, this variation would provide no additional cost savings over the elevated track structure alternative and would have significantly more community impacts and right-of-way costs.

Based on the property displacements and community impacts that would be created by grade-separating the roadways from the proposed CTA tracks (through either roadway overpasses or underpasses), CTA eliminated this variation from further consideration.

2.4.3 Halsted Alternative

CTA considered the Halsted Alternative, which would extend the Red Line from 95th Street Terminal along I-57, and south along Halsted Avenue to Vermont Avenue on a new elevated structure. The Halsted Alternative would run above Halsted Avenue with center piers, except at the station locations where the structures would span Halsted Avenue. The Halsted Alternative would result in travel times similar to those of the UPRR Alternative. The alternative included four stations, each with park & ride facilities. Construction costs for the Halsted Alternative were approximately 6 percent higher than for the UPRR Alternative. The Halsted Alternative was eliminated in August 2014 based on technical analysis and public feedback including the following concerns:

- The Halsted Alternative would not have the potential for a direct connection to other regional transit services[2] like the UPRR Alternative would; therefore, it would not meet the purpose and need for the project.

- The Halsted Alternative would affect four historic resources, resulting in adverse effects on historic properties, while the UPRR Alternative would not affect any historic resources.

- The proposed seven-story parking structure at Vermont Avenue would result in adverse visual impacts because of its location within a neighborhood with single-family homes.

- The Halsted Alternative would not directly serve as many affordable housing locations in the project area as the UPRR Alternative would serve, including Altgeld Gardens.

- The public expressed concern that implementation of the Halsted Alternative would be disruptive to the surrounding community and would increase shadows, crime, and noise along the Halsted Street.

- The Halsted Alternative did not receive the considerable public support before and during scoping in 2009 that the UPRR Alternative received.

2.5 Environmental Process

CTA will comply with applicable environmental regulations and will responsibly and reasonably mitigate adverse environmental impacts resulting from the RLE Project to the extent feasible in accordance with NEPA and FTA guidance. This Draft EIS identifies and analyzes worst-case scenario impacts of the East and West Options and proposes candidate mitigation measures to address the potentially adverse impacts. Throughout the Draft EIS, needs have been identified for more refined analyses such as traffic and noise, to further evaluate potential impacts. This additional analysis would be specific to the option (East or West Option) that is selected after the Draft EIS public hearing. Actual impacts may be smaller in magnitude and therefore may ultimately require less mitigation. The candidate mitigation measures will be refined as part of the Final EIS process, and a final set of commitments to mitigate adverse impacts would be included in the Final EIS and adopted by FTA upon issuance of the Record of Decision (ROD). In addition, CTA would continue to avoid and minimize environmental impacts wherever feasible.

2.5.1 Draft Environmental Impact Statement Review and Comment Period

Based on the analysis prepared to date and public comments received thus far, the NEPA Preferred Alternative is the UPRR Alternative. FTA and CTA will distribute this Draft EIS to affected federal, state, and local agencies; tribes; community groups; interested individuals; and other interested parties. The document will be made available at CTA headquarters, public libraries near the project area, and in electronic format on CTA's website (www.transitchicago.com). A formal public comment period will be initiated after release of this Draft EIS. CTA will hold a public hearing during the comment period to provide information and receive comments about this Draft EIS and the NEPA Preferred Alternative. Comments may also be submitted by mail or e-mail.

---

[2] Although the Halsted Alternative alignment would intersect the ME Blue Island branch, the southern terminus of that branch is less than 3 miles from the intersection at Halsted Street and is just west of the project area. The northern terminus of the ME Blue Island branch is only two blocks from the Red Line in the Loop. Intersection with the ME Blue Island branch would not provide regional service.

2.5.2 Final Environmental Impact Statement and Record of Decision

After public review of the Draft EIS, CTA and FTA will complete any additional analyses required and prepare the Final EIS. The Final EIS will include and address all of the comments received during the Draft EIS public comment period. The Final EIS will document the results of the Draft EIS process, confirm whether the East or West Option is the selected option, and include a list of committed final mitigation measures.

In accordance with the FAST Act and 23 United States Code (USC) § 139(n), FTA intends to issue a single document that consists of the Final EIS and ROD unless it is determined that circumstances, such as changes to the proposed action, anticipated impacts, or other new information, preclude issuance of such a combined document. The ROD will include the alternatives and options that FTA considered and CTA's commitments to mitigate the adverse impacts of the RLE Project. Additionally, in accordance with 40 CFR § 1505.2(b) of NEPA, the ROD will include an identification of the environmentally preferable alternative. Finally, the ROD will include a list of mitigation commitments that must be implemented when the project is initiated. FTA's issuance of the ROD concludes the NEPA environmental process and is required for federal funding and approvals to proceed.

Chapter 3
Transportation

This chapter describes the potential benefits and adverse impacts that would result from the East and West Options on the existing transportation facilities in the project area, including public transportation, vehicular and freight traffic, bicycling, pedestrians, and parking facilities. Also described here are mitigation measures to minimize adverse impacts where feasible. The information in this chapter is based on the *Transportation Technical Memorandum* (**Appendix H**). **Table 3-1** summarizes the transportation impact findings.

In this chapter, permanent and construction-related impacts are included as part of the discussion of each resource area. The *Construction Impacts Technical Memorandum* (**Appendix I**) describes how construction activities would potentially affect transportation facilities as well as the resources described in **Chapter 4**.

Table 3-1: Transportation - Impacts Summary

Alternative	Permanent Impacts						Construction Impacts
	Public Transportation	Vehicular Traffic	Pedestrians	Bicycle Facilities	Freight Transportation	Parking	
No Build	No impacts	Adverse Impacts	No impacts	No impacts	No impacts	No impacts	No impacts
Union Pacific Railroad - East Option	Benefits	Impacts would not be adverse after mitigation	Impacts would not be adverse after mitigation	Benefits	No impacts	No impacts	No impacts
Union Pacific Railroad - West Option	Benefits	Impacts would not be adverse after mitigation	Impacts would not be adverse after mitigation	Benefits	No impacts	No impacts	No impacts

3.1 Regulatory Framework/Methods

CTA conducted the transportation analysis in compliance with current FTA guidelines, NEPA regulations, and the FAST Act. Illinois state law does not require additional analysis beyond the requirements of NEPA.

CTA studied local resources to understand the existing transportation network and other planned projects near the project corridor. These resources included *GO TO 2040*, City of Chicago transportation and community plans, and IDOT studies. *GO TO 2040* provides strategies and priorities for the future development of the regional transportation network.

3.1.1 Public Transportation

CTA reviewed existing public transportation data (CTA, Metra, and Pace) within the project area. The analysis included a review of geographic coverage of service, travel time, frequency and hours of service, ridership, transit mode share, and train station and bus stop locations.

Benefits to public transportation would result from improvements in transit service. An adverse impact on public transportation would occur if there were negative changes associated with geographic areas of service and routing, travel time, frequency and hours of service, transit patronage and demand (including transit mode share), station access and circulation, and/or traffic around stations.

3.1.2 Vehicular Traffic

The RLE Project would include park & ride facilities that could cause vehicular traffic impacts because of additional vehicular traffic introduced near the new stations. CTA conducted a detailed vehicular traffic analysis at 74 locations within the area of potential impact (API). A total of 76 intersections were analyzed; two of the intersections are offset and were therefore analyzed as separate intersections near the same location. **Figure 3-1** shows the API and the intersections analyzed.

Figure 3-1: Study Intersections for Transportation Impact Analysis

To understand the existing vehicular traffic conditions within the project area and identify peak-hour turning movements, CTA compiled existing traffic count data from IDOT, CMAP, and CDOT. In addition, CTA collected new manual traffic counts at major intersections and intersections where existing data were not available. CTA compiled and reviewed the following traffic data:

- Traffic distribution and local circulation patterns
- Vehicle occupancy levels
- Road capacity levels
- Road peak-hour traffic volumes
- Intersection lane geometry and traffic signal timing plans
- Planned roadway improvements

CTA used the data to calculate existing intersection level of service (LOS) using Synchro 7.[3] The *Transportation Technical Memorandum* (**Appendix H**) includes peak-hour traffic volumes and lane geometry used for the intersection LOS analysis.

For this Draft EIS, construction of the RLE is anticipated to occur from the year 2022 through 2025. Project construction is dependent on the availability of project funding and approvals. For the traffic analysis, CTA used the project construction (opening) year of 2026 and the horizon year of 2030 to determine potential traffic impacts. The 2030 horizon year is consistent with the ridership analysis conducted for the RLE Project.

CTA used data from CMAP's 2030 Regional Travel Demand model (CMAP 2012c) to develop "no-project" intersection-level traffic projections. These "no-project" traffic projections accounted for the background growth in traffic due to additional regional and subregional land use development and population growth. CTA determined the background growth of traffic for roadway segments using the data from the regional model. Average annual traffic growth for roadway segments was 0–1.3 percent.

To simulate opening year (2026) conditions without the project, CTA interpolated background traffic growth between existing year (2012) and horizon year (2030) No Build Alternative conditions. The No Build Alternative traffic projections served as the baseline for evaluating the future "with project," (i.e., the build alternative - East or West Option). Conditions for the East and West Options included the generation of park & ride automobile trips to the proposed stations. The analysis did not include a mode shift from vehicles to transit, which is anticipated to occur when the project is built. The traffic analysis represents the "worst-case" scenario for impact analysis.

---

[3] Synchro 7 is a software package used for performing intersection capacity analysis and optimizing traffic signal timing.

The build alternative-generated trips were added to the No Build Alternative traffic projections to develop the build alternative traffic volumes. The build alternative intersection LOS analyses were conducted for the study intersections. For this Draft EIS, a traffic (passenger or freight vehicle) impact would be substantial if it would result in a degradation in peak-hour LOS at any intersection within the API that leads to a change in traffic distribution and local circulation patterns, a change in vehicle occupancy levels, a change in road capacity, or a change in road traffic volumes.

The LOS for roadway intersections typically ranges from A to F (Transportation Research Board 2010). LOS is defined as follows:

- LOS A - Virtually free flow of traffic with no congestion or delay.
- LOS B - Stable traffic flow, but other vehicles in the flow are noticeable.
- LOS C - Stable flow, but this LOS marks the beginning of the range where individual vehicles become affected by interactions with other vehicles in the traffic stream.
- LOS D - High density of traffic but stable flow.
- LOS E - Operating conditions at or near capacity level. All speeds are reduced to a low but relatively uniform flow.
- LOS F - A breakdown in the operating conditions resulting in congestion and delay.

CTA coordinated with IDOT and CDOT regarding LOS thresholds, and for this analysis a change in intersection LOS from LOS A, B, C, or D under the No Build Alternative to LOS E or F under the build alternative would result in an adverse or substantially adverse impact. CTA identified mitigation measures to reduce the impacts to a more acceptable LOS for adverse impacts caused directly by project facilities, when those impacts would not be offset by the additional transportation benefits provided by the project alternative.

3.1.3 Pedestrians

To describe existing conditions for pedestrians, CTA reviewed aerial photographs, City of Chicago geographic information system and geospatial datasets, and the *Chicago Pedestrian Plan (*City of Chicago 2012b). CTA reviewed pedestrian facilities within the immediate area of the proposed station locations for ADA accessibility and conformity to transit station planning.

For this Draft EIS, a pedestrian impact would be adverse if it were to result in the disruption of an existing or planned pedestrian pathway, if it were to limit pedestrian access to proposed station entrances, or if pedestrian access to a proposed station were limited because the vicinity around the station did not have sidewalks or the sidewalks were not ADA-accessible.

3.1.4 Bicycle Facilities

To describe existing conditions for bicycle facilities, CTA reviewed IDOT's 2012 bicycle map and existing and proposed bicycle facilities for the City of Chicago based on the *Chicago Streets for Cycling Plan 2020* (City of Chicago 2012a). CTA evaluated the relationship of the existing bicycle facilities to the proposed station location and assessed whether the proposed station locations would conform to the objectives of the bicycle plans for an area within ½ mile of the stations.

For this Draft EIS, a bicycle facility impact would be adverse if it were to result in a disruption of existing or planned bicycle pathways or bicycle parking facilities.

3.1.5 Freight Transportation

This Draft EIS includes a qualitative discussion of impacts from the RLE Project on freight traffic (both rail and truck). CTA qualitatively examined the existing and projected freight traffic in the project area and determined whether the RLE Project would permanently interrupt freight movements. Through a coordination process, CTA and UPRR identified potential impacts and discussed them qualitatively.

For this Draft EIS, an impact on freight transportation would be adverse if the movement of goods and services would be disrupted or delayed.

3.1.6 Parking

To describe existing parking conditions, CTA reviewed community resources and aerial photographs and performed field observations. Using the No Build Alternative as the baseline, CTA analyzed the extent to which the East and West Options would affect on-street parking and off-street parking facilities. CTA reviewed parking capacity near the location of each proposed station and park & ride facility for potential impacts on the surrounding neighborhoods. Potential parking impacts would include changes in parking supply as a result of transit facility construction/service expansion, addition of park & ride facilities, and removal of existing parking spaces. To determine the potential for impacts and the intensity of those impacts, CTA developed guidelines based on standard industry practices.

For this Draft EIS, a parking impact would be adverse if it were to result in the following:

- Reduction in parking spaces by 10 to 50 spaces. A reduction by 50 or more parking spaces would be a substantially adverse impact.
- Reduction in accommodation for future programs requiring parking spaces, such as car sharing.
- Reduction in existing transit parking and park & ride capacity.
- Inadequate parking capacity for proposed transit service.

3.2 Existing Conditions

The existing transportation environment includes transit facilities for rail and bus, expressways, regional arterials (through roads), truck routes, intermodal connectors, secondary arterials, local streets, and bicycle and pedestrian facilities. Expressways in the project area include I-57 and I-94.

The 95th Street Terminal is currently the southern end of the Red Line. Many existing bus routes within the project area terminate at this location. From this station, passengers travel north on the Red Line or transfer to a different bus route. Passengers accessing the station by bus experience delays resulting from poor performance of the surrounding roadway network. The availability of alternative modes of transportation to reach the 95th Street Terminal is limited, resulting in lengthy travel times by both auto and transit to jobs north of 95th Street, including the major employment centers in downtown Chicago. According to the American Community Survey, from 2005 to 2010 the average travel time to work for residents within the project area was 39 minutes. This number is approximately 20 percent higher than the 32-minute average commute time for the seven-county region. The current transit travel time from 130th Street to the 95th Street Terminal is 28 minutes and it is 25 minutes from the 95th Street Terminal to Jackson station (CTA 2009). The limited transit services in the project area and complex transfers to reach the 95th Street Terminal make commute times to the downtown Chicago area more than an hour for some residents. Approximately 10 percent of the project area residents (as of 2010) do not own a car and depend on transit for mobility (U.S. Census Bureau 2010). One-fourth of the trips that project area residents make between their home and work are with transit (U.S. Census Bureau 2010).

Substantial expressway congestion occurs within and surrounding the project area. The expressway network was at or over capacity during the morning peak periods in 2010 and congestion is expected to worsen by 2030. Arterial street reliability is compromised by delays from at-grade freight railroad crossings, affecting travel times to the 95th Street Terminal. ME commuter trains that operate at grade and cross several arterials in the project area also cause short traffic delays.

3.2.1 Public Transportation

The existing public transportation systems in use in the project area are CTA rail service, CTA bus routes, Pace bus routes, and Metra commuter rail service. The Red Line 95th Street Terminal is the only CTA rail station within the API and is the southern end of the CTA Red Line. Greyhound and Indian Trail intercity bus service operate from the 95th Street Terminal, with fixed routes outside the project area. The 2014 average weekday rail ridership for 95th Street Terminal was approximately 11,598 passengers (CTA 2014). Rail service is provided 24 hours per day, and rail service frequency is 6 minutes during morning peak periods and 3 minutes during afternoon peak periods. CTA and Pace bus routes are on east-west and north-south thoroughfares through the project area, with 16 CTA and 6 Pace bus routes operating within the API (not including night bus routes). Of those bus routes, 18 serve the 95th Street Terminal. **Figure 3-2** shows the existing CTA and Pace bus routes as well as Metra routes and station locations. **Table 3-2** provides a summary of existing bus service in the API.

Notes:

1. #9 Ashland serves the 95th Street Terminal only with the Night Owl Service.
2. Night service route #N5 is not included in the above table.
3. Service to the 95th Street Terminal is based on route maps current as of July 2015.

NICTD/CSS & SBRR provided limited commuter rail service to the Kensington/115th Street station until early 2012, when service was discontinued at this station. Metra commuter rail service in the API includes the ME mainline, the ME Blue Island branch, and the Metra Rock Island District mainline. There are 11 commuter rail stations within the API. **Figure 3-2** shows Metra station locations. **Table 3-3** summarizes the existing commuter rail stations and ridership within the API.

3.2.2 Vehicular Traffic

The following interstate, regional, and local roadways provide east-west and north-south routes within the API:

East-West	North-South
95th Street	I-57
99th Street	Halsted Street
103rd Street	Wentworth Avenue
107th Street	State Street
111th Street	Michigan Avenue
115th Street	Indiana Avenue
119th Street	Martin Luther King Drive
127th Street	Cottage Grove Avenue
130th Street	I-94 (Dan Ryan Expressway/Bishop Ford Freeway)

Table 3-4 summarizes existing (2012) traffic conditions. Under existing conditions, most of the study intersections within the API operate at LOS D or better in both the AM and PM peak periods. Intersections operating at LOS E or F under existing conditions are highlighted in **Table 3-4**.

Table 3-4: Existing (2012) Intersection Level of Service

74	130th Street and Ellis Avenue	Signalized	A	A

LOS = level of service

[1] Signalized intersection LOS is reported as the average for all movements. Unsignalized intersection LOS reported is the LOS of the worst movement. Intersections with LOS E and F that would be worse than the No Build conditions are shown in bold.

[2] Intersections #42 and #55 are offset; therefore, each leg was analyzed separately (as #42a/42b and #55a/55b).

3.2.3 Freight Transportation

Nearly 500 freight trains per day operate in the Chicago region (Chicago Metropolis 2020, 2004). In 2007, regional rail tonnage was estimated at more than 631 million tons, with about 24,000 trailers and containers and about 16,800 carload units moving into, out of, or through the region daily (CMAP 2012b). The following active freight railways operate through the API and are identified on **Figure 3-3**:

- UPRR
- CN/ME
- NICTD/CSS & SBRR
- Norfolk Southern Railway
- Indiana Harbor Belt Railroad
- Conrail

The UPRR reported 27 freight trains per day within the API. In addition, Amtrak runs two passenger trains per day on the UPRR tracks within the API. The CN/ME tracks carry both passenger and freight trains. The NICTD/CSS & SBRR tracks converge with the CN/ME tracks between 115th Street and Kensington Avenue and both carry passenger and freight trains.

Figure 3-3: Freight Railroads within the Area of Potential Impact

3.2.4 Bicycle Facilities

Chicago has over 200 miles of on-street bicycle pathways and 36 miles of trails. In addition, the city has more than 12,000 racks for bicycle parking, including racks at CTA stations (City of Chicago 2012a). The *Chicago Streets for Cycling Plan 2020* guides the development of a citywide network of innovative bicycle pathways and proposes 645 miles of on-street cycling routes. CTA identified existing bicycle facilities within ½ mile of the alternative alignments (see **Figure 3-4**). Bicycle facilities recommended in the Chicago Bike 2015 Plan (City of Chicago 2006) and pertinent recommended cycling routes from the *Chicago Streets for Cycling Plan 2020* are also shown on the figure.

Major Taylor Trail is an off-street cycling trail that runs through the project area. There are no other marked bicycle lanes within the roadway along or crossing the alternative alignments.

3.2.5 Pedestrians

Throughout the project area, sidewalks are located on both sides of most of the arterial and collector roads. CTA qualitatively reviewed sidewalks within the API. Sidewalk width varies throughout the API. Arterial streets have a standard, 6-foot-wide sidewalk and collector streets have sidewalks that are 12 to 17 feet wide. There are no pedestrian gates along the sidewalks at the existing UPRR grade crossings within the API.

The City of Chicago is continually updating intersection curb ramps to meet current ADA guidelines and design standards. There are wheelchair accessible curb ramps at most of the intersections within the API, but most of these curb ramps are not fully compliant under current ADA standards, which require detectable warning tiles for the visually impaired.

CDOT is implementing its *Chicago Pedestrian Plan* (City of Chicago 2012b). The plan aims to increase pedestrian safety, identify and eliminate gaps and barriers in the pedestrian network, increase the amount and quality of pedestrian space, and increase the number of pedestrian trips for enjoyment, school, work, and daily errands.

3.2.6 Parking

Most of the streets in the API have on-street parking. **Table 3-5** summarizes the on-street parking along the major roadways along the alternative alignments. On-street parking is allowed (as posted) on most of the local streets not listed in this table. There is currently no park & ride facility at the existing 95th Street Terminal.

Table 3-5: Existing On-Street Parking

Street	Roadway Functional Class	On-Street Parking
95th Street	strategic regional arterial	No
99th Street	local road or street	Yes
103rd Street	minor arterial	Yes
107th Street	major collector	No
111th Street	minor arterial	Yes
115th Street	major collector	Yes
119th Street	minor arterial	Yes
127th Street	other principal arterial	No
130th Street	other principal arterial	No
Wentworth Avenue	major collector	Yes
State Street	minor arterial	Yes
Michigan Avenue	major collector	Yes
Indiana Avenue	minor arterial	No

A permit or fee is not required to park on the streets within the API. There are no existing off-street surface parking lots or garages used for public parking within the API. Many of the commercial and retail buildings within the API have parking available either through on-street parking or parking lots associated with the buildings.

3.3 Environmental Consequences

The following sections summarize the potential transportation impacts and mitigation measures of the No Build and UPRR Alternative.

3.3.1 No Build Alternative

Under the No Build Alternative, the project would not be constructed and traffic flow in the project area would continue to deteriorate. There would be a continued lack of rapid transit rail service south of 95th Street. *GO TO 2040* calls for investment in the existing transit infrastructure in the region, and the No Build Alternative would not achieve this. **Table 3-6** summarizes 2030 baseline (No Build Alternative) LOS. The intersections shown in **Table 3-6** would operate at a LOS D or worse under the No Build Alternative by 2030. There would be an adverse impact on transportation under the No Build Alternative. There would be no major construction associated with No Build Alternative; therefore, no construction-related transportation impacts would occur.

Table 3-6: No Build Alternative - Intersection Level of Service (2012 and 2030)

ID	Intersection	2012 Conditions		2030 Baseline	
		AM Peak-Hour LOS	PM Peak-Hour LOS	AM Peak-Hour LOS	PM Peak-Hour LOS

70	127th Street and Vermont Avenue and Wallace Street	C	D	D	D

LOS = level of service, EB = eastbound, WB = westbound

3.3.2 Union Pacific Railroad Alternative - East Option

Permanent Impacts

Because the East and West Options would both run along the same corridor, the nature of transportation impacts for both options would be similar.

Public Transportation

With the extension of the Red Line, some existing bus routes would be rerouted to feed into the proposed stations (see **Appendix H** for additional details). CTA passengers would benefit from faster travel times by accessing rail service farther south. Year 2030 average weekday projected boardings with the UPRR Alternative would total approximately 42,000 passengers (CTA 2009). These estimates were developed using computerized travel forecasting models. Project boardings include the number of boardings at each new station and the number of travelers who are on board the trains on the extension as they leave the 95th Street Terminal. Implementation of the East Option would reduce congestion at 95th Street Terminal by reducing the number of bus transfers that passengers would need because they could transfer or directly board the Red Line at the proposed stations.

Public transportation would benefit from the East Option because of the new, direct rail service within the project area. The East Option would also allow for potential connections to regional commuter rail, particularly to NICTD at the 130th Street station where the NICTD tracks would be parallel to the RLE tracks. The park & ride facility at the 130th Street station may also benefit future commuter rail passengers, such as NICTD passengers, if future connections are built.

Vehicular Traffic

Traffic impacts would arise from changed travel patterns to reach the proposed stations. Traffic impacts for both the East and West Options would be similar. Both the East and West Options would operate along an existing active freight railroad corridor and impacts would occur due to the active roadway-railroad grade crossings. Additional delay analysis for vehicular traffic due to the freight railroad operations was not conducted. Depending on the option selected, a delay analysis may be warranted. The delay analysis would include the vehicular traffic generated by the park & ride facilities and would determine the additional delay that might be created at the at-grade crossings. The delay analysis would be dependent upon projected traffic growth, projected freight traffic, and location of the park & ride facilities.

Under both the East and West Options, adverse vehicular traffic impacts (2026 and 2030) would occur under 2026 and 2030 conditions at the intersections identified in **Table 3-7**. Adverse impacts would occur because these intersections would operate at a LOS worse than they would with the No Build Alternative. All increases in traffic volumes would be related to vehicle access at park & ride facilities.

Table 3-7: Union Pacific Railroad Alternative (2026 and 2030) Intersection Level of Service

ID	Intersection	Control Type	2026 Union Pacific Railroad Alternative		2030 Union Pacific Railroad Alternative	
			AM Peak Hour LOS	PM Peak Hour LOS	AM Peak Hour LOS	PM Peak Hour LOS

74	130th Street and Ellis Avenue	Signalized	A	D	B	**E**

UPRR = Union Pacific Railroad, LOS = level of service
Signalized intersection LOS reported as the average for all movements. Unsignalized LOS reported is the LOS of the worst movement. Intersections with LOS E and F that would be worse than the No Build conditions are shown shaded and in bold.

Mitigation - For intersections where adverse impacts are expected, CTA has identified potential mitigation measures to offset the portion of the LOS deterioration attributable to the East Option (**Table 3-8**). Mitigation measures for intersections near the affected intersection may also be necessary to provide better flow of traffic; therefore, the proposed mitigation measures include the 15 affected intersections as well as 4 adjacent or nearby intersections. If the East Option is selected, CTA will conduct additional traffic analysis to refine and optimize the mitigation measures described in **Table 3-8**.

Table 3-8: Mitigation Measures for the Union Pacific Railroad Alternative (2030) Conditions

ID	Intersection	Mitigation Measure
16	103rd Street and Halsted Street	PM: Adjust traffic signal timing and amount of time allotted to each phase of the signal to improve traffic flow.
41	111th Street and Cottage Grove Avenue	PM: Adjust amount of time allotted to each phase of the signal to improve traffic flow.
52	115th Street and Michigan Avenue	AM: Adjust amount of time allotted to each phase of the signal to improve traffic flow. PM: Adjust traffic signal timing and amount of time allotted to each phase of the signal.
54	115th Street and Martin Luther King Drive	Remove on-street parking lane for additional eastbound/westbound through lane on 115th Street.
55a	115th Street and Cottage Grove Avenue	AM/PM: Adjust traffic signal timing. Adjust amount of time allotted to each phase of the signal in the PM.
55b	115th Street and Cottage Grove Avenue East	AM/PM: Adjust traffic signal timing. Adjust amount of time allotted to each phase of the signal in the PM.
59	119th Street and Ashland Avenue	PM: Adjust amount of time allotted to each phase of the signal.
61	119th Street and Wentworth Avenue	PM: Adjust amount of time allotted to each phase of the signal.
62	119th Street and State Street	AM/PM: Adjust amount of time allotted to each phase of the signal.
63	119th Street and Michigan Avenue	AM: Adjust amount of time allotted to each phase of the signal.
64	127th Street and Paulina Street	AM/PM: Adjust traffic signal timing and amount of time allotted to each phase of the signal.
65	127th Street and Marshfield Avenue	AM/PM: Adjust traffic signal timing and amount of time allotted to each phase of the signal.
66	127th Street and Ashland Avenue	AM/PM: Adjust traffic signal timing and amount of time allotted to each phase of the signal.

ID	Intersection	Mitigation Measure
68	127th Street and Halsted Street	AM/PM: Adjust traffic signal timing and amount of time allotted to each phase of the signal.
70	127th Street and Vermont Avenue and Wallace Street	Add an additional northeast right turn lane. Change westbound through/left lane to dedicated westbound left turn lane. Restrict northeast bound-to-northbound movement. Install traffic detection to provide green signal phases in response to traffic presence and volume. Adjust traffic signal timing and amount of time allotted to each phase of the signal.
71	127th Street and State Street	AM/PM: Adjust traffic signal timing and amount of time allotted to each phase of the signal.
72	127th Street and Michigan Avenue	PM: Adjust traffic signal timing and amount of time allotted to each phase of the signal.
73	130th Street and Indiana Avenue	AM/PM: Add northbound right turn lane. Adjust traffic signal timing and amount of time allotted to each phase of the signal.
74	130th Street and Ellis Avenue	PM: Adjust amount of time allotted to each phase of the signal.

Mitigation measures proposed for Intersections #64, #65, #66, and #72 would provide for better flow of traffic to help address traffic impacts at nearby intersections.
Traffic signal timing optimization reduces travel time, reduces total system delay, and improves mobility within the urban transportation system. The need to allocate green signal time to certain legs of an intersection changes over time as traffic volumes change. Optimum allocation of the green signal time based on the volume of traffic in each direction would reduce wait times at intersections and improve traffic flow. In a system network, optimizing the system reduces total delay along a corridor.

Under mitigated East Option 2030 conditions, some intersections would operate at LOS E or F; however, these intersections would be no worse than under No Build Alternative (2030) conditions. **Table 3-9** shows the LOS after implementation of mitigation measures. Mitigated conditions would not result in additional intersections with unacceptable LOS. There would be no adverse permanent traffic impacts from the East Option.

Table 3-9: Union Pacific Railroad Alternative - Intersection Level of Service (2012 and 2030)

LOS = level of service, N/A = not applicable

Pedestrians

Implementing the East Option would result in benefits for pedestrians at stations by upgrading the intersections immediately adjacent to the stations with ADA-accessible curb ramps and replacing deteriorated sidewalks. These improvements would provide access for all users and would increase pedestrian safety.

Park & ride facilities would be located to the east and west of the East Option alignment at the 103rd Street, 111th Street, and Michigan Avenue stations. Because of the location of the parking, passengers using the park & ride lots would need to cross the active UPRR tracks to reach the 103rd Street, 111th Street, and Michigan Avenue stations. The East Option would therefore result in pedestrian safety impacts. Pedestrians coming from the west would also need to cross the at-grade freight tracks.

Mitigation - If warranted by an engineering traffic study, CTA may install traffic signals to mitigate pedestrian safety impacts. To further mitigate impacts and improve pedestrian safety, CTA would consider installation of security surveillance cameras, alarm notifications (e.g., flashing blue lights), sidewalk lighting in the immediate vicinity of station entrances, pedestrian crossing treatments, such as refuge medians with appropriate signage, and police patrols. To mitigate adverse safety impacts at the roadway-railroad grade crossings, CTA would install safety cameras and would consider other options to increase safety. CTA would install fencing to deter pedestrians from crossing the freight railroad tracks in places other than the designated locations. Permanent impacts on pedestrians would not be adverse after mitigation.

Bicycles

Implementation of the East Option would be beneficial to bicyclists with the addition of bicycle parking at the proposed stations.

Freight Transportation and Parking Facilities

There would be no adverse impacts on freight transportation or parking facilities under the East Option. Sufficient parking capacity would be provided at all stations to avoid spillover parking into residential areas near the stations.

Construction Impacts

Construction associated with the East Option would temporarily affect the physical capacity of roadways and intersections subject to detours. These detours may lead to increased travel times and possible shifts in traffic volumes, increasing travel times for bus passengers, traffic, and pedestrians. Lane closures and detours would be implemented during off-peak traffic times to minimize construction impacts. CTA would phase construction to minimize impacts on passenger trains.

Construction within the I-94 and I-57 right-of-way would require temporary lane closures. CTA would sequence the structure construction to minimally affect traffic flow on either expressway. For erection of superstructures over expressway traffic lanes, temporary shutdown of all traffic would be required; per IDOT approval, traffic shutdowns would occur at times of low traffic volume. Increased traffic congestion due to construction may temporarily increase travel times along the expressways. During final design of the project and as a requirement for the project, CTA would prepare traffic management and maintenance of traffic plans that identify traffic detours and emergency access routes. CTA would coordinate traffic management with the FHWA, IDOT, Cook County Department of Transportation and Highways, and CDOT. Contractors would follow the Manual on Uniform Traffic Control Devices (MUTCD) design standards for temporary traffic control and would obtain required permits. The application of traffic management and maintenance of traffic plans as well as MUTCD design standards would minimize the temporary construction impacts. Contractors would also consider locations of schools, parks, and daycares when deciding where to route local traffic and construction equipment, and to the extent possible, route traffic away from places where children congregate.

Because UPRR freight operations would still be active in the UPRR right-of-way during construction of the East Option, CTA would need to move signal devices or install temporary signals to replace existing signals during construction of viaducts for the following at-grade crossings: 101st Street, 103rd Street, 107th Street, 109th Street, 111th Street, 115th Street, and State Street. Flagging operations and scheduled track closures would occur during construction activities near or adjacent to railroads.

Impacts Remaining After Mitigation

The East Option would result in permanent benefits to public transportation, pedestrians, and bicycles. Permanent impacts on vehicular traffic would not be adverse after mitigation. There would be no permanent impacts on freight transportation and parking facilities. Construction-related impacts would not be adverse.

3.3.3 Union Pacific Railroad Alternative - West Option

Permanent Impacts

Because the East and West Option alignments would run along the same corridor, the nature of impacts for each of the options would be similar.

Public Transportation

The West Option would have the same impacts on public transportation as the East Option. Like the East Option, the West Option would allow for potential connections to regional commuter rail, particularly to NICTD at the 130th Street station where the tracks are adjacent. The park &

ride facility at 130th Street station may also benefit future commuter rail passengers, such as NICTD passengers, if future connections are built.

Vehicular Traffic

With either the East or West Options, impacts on vehicular traffic and pedestrians would occur due to the active roadway-railroad grade crossings. If the West Option were selected, CTA would conduct additional traffic analysis to refine and optimize mitigation measures described in **Table 3-8**.

Pedestrians

Because the West Option park & ride facilities would be on the west side of the UPRR tracks, passengers using the park & ride facilities would not need to cross the active UPRR tracks to access the station, as they would for some park & ride facilities with the East Option. Some pedestrians traveling from the east would need to cross the active UPRR tracks to access the station.

Mitigation - Mitigation measures for the West Option would be same as for the East Option. Permanent impacts on pedestrians would not be adverse after mitigation.

Bicycles

Implementation of the West Option would be beneficial to bicyclists with the addition of bicycle parking at the proposed stations.

Freight Transportation and Parking Facilities

Like the East Option, the West Option would have no adverse impacts on freight transportation or parking.

Construction Impacts

Construction impacts of the West Option would be similar to those of the East Option with the exception that the West Option alignment would cross over the active UPRR tracks at two locations: Fernwood Parkway and Prairie Avenue. Construction at the crossings would be phased to minimize impacts on UPRR freight operations.

Impacts Remaining After Mitigation

The West Option would result in permanent benefits to public transportation and bicyclists. Permanent impacts on vehicular traffic and pedestrians would not be adverse after mitigation. There would be no permanent impacts on freight transportation and parking facilities. Construction-related impacts would not be adverse.

Chapter 4
Environmental Impacts and Mitigation

This chapter describes the potential benefits and adverse impacts that would result from the East and West Options along with possible mitigation measures to avoid or minimize adverse impacts where feasible. Mitigation presented in this Draft EIS consists of potential measures that are provided for public review and comment. Mitigation measures will be confirmed in the Final EIS. For each section in this chapter, a technical memorandum describes the potential environmental impacts and mitigation in more detail. The *Construction Impacts Technical Memorandum* (**Appendix I**) describes how construction activities would potentially affect many of the resources described in this chapter.

Section 4.1 Land Use and Economic Development
Section 4.2 Displacement and Relocation of Existing Uses
Section 4.3 Neighborhoods and Communities
Section 4.4 Visual and Aesthetic Conditions
Section 4.5 Noise and Vibration
Section 4.6 Safety and Security
Section 4.7 Historic and Cultural Resources
Section 4.8 Hazardous Materials
Section 4.9 Wetlands

4.1 Land Use and Economic Development

This section describes the impacts of the East and West Options on the land uses and economic development in the project area, including consistency with applicable land use plans. The information in this section is based on the *Land Use and Economic Development Technical Memorandum* (**Appendix J**). **Table 4-1** summarizes the land use and economic development impact findings.

Table 4-1: Land Use and Economic Development - Impacts Summary

Alternative	Permanent Impacts		Construction Impacts
	Land Use	Economic Development	
No Build	No impacts	No impacts	No impacts
Union Pacific Railroad - East Option	Impacts would not be adverse after mitigation	Benefits	Impacts would not be adverse after mitigation
Union Pacific Railroad - West Option	Impacts would not be adverse after mitigation	Benefits	Impacts would not be adverse after mitigation

4.1.1 Regulatory Framework/Methods

Regional and local planning bodies govern land use and zoning regulations. Within Chicago, CMAP acts as the regional planning body and defines the regional planning principles, while the City of Chicago regulates land use policies and zoning within its local jurisdictional boundaries. CTA evaluated existing land use, zoning, and relevant land use and economic development plans for parcels directly adjacent to the alignment, for the full length of the alignment, as well as those parcels within ½ mile of stations per FTA's 2004 *Guidelines and Standards for Assessing Transit-Supportive Land Use* (FTA 2004). The project could directly or indirectly affect land uses and economic development plans within ½ mile of project stations.

For this Draft EIS, a land use change may result in an adverse impact if it would be incompatible with surrounding land uses or could encourage land use and development inconsistent with local plans, goals, and objectives. An economic impact may result if one or more of the following occurs:

- Direct or indirect changes to the tax code or property taxes
- Substantial displacement of businesses (especially major employers) and individuals, defined in this analysis as those of a magnitude that would preclude relocation in the immediate area due to lack of available real estate
- Short- and/or long-term disruption of business activities
- Impacts that would influence regional construction costs

For each community area, CTA analyzed whether each option could cause adverse land use and economic impacts using the following:

- Analysis of the potential for short-term and long-term conflict with, or disruption of access to, land uses adjacent to the alternative alignments
- Identification of potential conflicts with local land use plans, policies, or regulations
- Identification of potential land use benefits of the East and West Options, such as opportunities for economic development and transit-supportive land uses

CTA analyzed whether the Build Alternative could cause land use and economic impacts. This analysis included reviewing existing land use plans and zoning maps and using field observations of the project corridor to determine consistency of the project with the goals and policies presented in the local and regional land use plans and studies of the City of Chicago and CMAP, including the following:

- CMAP - *GO TO 2040* (2010)
- City of Chicago - *Calumet Area Land Use Plan* (2002)
- City of Chicago, Chicago Park District, and Forest Preserve District of Cook County - *Cityspace: An Open Space Plan for Chicago (1998)*

- Chicago Housing Authority - *Plan Forward: Communities That Work* (2013)
- City of Chicago - *Chicago Sustainable Industries, Phase One: A Manufacturing Work Plan for the 21st Century* (2011)
- City of Chicago and CTA - *Transit-Friendly Development Guide* (2009)
- DCP, Metropolitan Planning Council, CMAP, and Center for Neighborhood Technology - *What Will Your Station Look Like?* (2010)
- CMAP, DCP, CTA - *Improving Access, Increasing Livability: The CTA Red Line South Extension* (2012)
- Cook County - *Comprehensive Economic Development Strategy Report* (2009)
- CDOT - *130th Street Station Market/Access Study* (2010)
- University of Illinois at Chicago Voorhees Center - *Transit Equity Matters: A Regional Analysis of the Red Line and Two Other Proposed CTA Transit Line Extensions* (2009)
- University of Illinois at Chicago Voorhees Center - *The Case for Transit-Oriented Development in the Greater Roseland Area* (2005)

The applicable plans promote commercial and residential development around transit stations, as well as economic development region-wide. The plans are also compatible with the project goals of strengthening the linkages between transit and the surrounding neighborhoods. Further, the plans emphasize the integral role that transit service plays in supporting livable communities. Recommendations in the plans include improvement of pedestrian facilities, zoning for transit-oriented development around stations, including affordable housing, and engaging communities in station area planning and development. The *Land Use and Economic Development Technical Memorandum* (**Appendix J**) includes additional details about these plans.

4.1.2 Existing Conditions

The overall project area has residential (primarily single-family), commercial (urban mixed-use), industrial, transportation, utility, and vacant land uses. **Figure 4-1** depicts the overall land uses affected by the RLE Project, and **Figure 4-2** shows the existing zoning.

The UPRR Alternative alignment would begin within the I-57 right-of-way, north of the southbound lanes of I-57, and would follow the UPRR track southward. The surrounding land uses are primarily single-family residential properties north of I-57 and on the eastern side of the alignment, with a mix of primarily single-family residential properties and industrial properties to the west. There are typically one or two vacant properties per block in the residential areas and large vacant parcels near Michigan Avenue, some of which are slated for development. South of 119th Street, the surrounding land uses abruptly transition to industrial, railroad, and major utility sites. The Altgeld Gardens public housing project is at the southern end of the proposed alignment. **Appendix J** contains a more detailed description.

4.1.3 Environmental Consequences

The following sections summarize the potential land use and economic impacts of each alternative.

4.1.3.1 No Build Alternative

Although it does not recommend specific plans for redevelopment, *GO TO 2040* identifies many potential infill areas within the project area that could be developed under the No Build Alternative. *GO TO 2040* estimates that for wards 9, 21, and 34, where the project would take place, the combined population and combined employment would increase by 14 and 39 percent, respectively, if the infill were to occur. Population and employment for the city as a whole is expected to increase by 15 and 17 percent, respectively. The No Build Alternative would be inconsistent with the goals of *GO TO 2040*, which lists the RLE Project as a fiscally constrained project. The No Build Alternative would be inconsistent with Cook County's *Comprehensive Economic Development Strategy Report,* which supports the RLE Project. The No Build Alternative would not create any new inconsistencies to land uses and economic development beyond those that already exist, and therefore would have no impact on land use or economic development.

4.1.3.2 Union Pacific Railroad Alternative - East Option

Permanent Impacts

Displacements would occur as a result of the construction of the track structure and park & ride facilities (see **Section 4.2**). The proposed Michigan Avenue station parking structure would have ground-floor retail and community facility space, which could help offset the land use and economic impacts of displacements. The following potentially adverse impacts would occur:

- The park & ride facilities at the 103rd Street, 111th Street, and Michigan Avenue stations would be inconsistent with adjacent land uses, and zoning designations do not permit large, stand-alone surface parking lots or garages.

- The substation just north of Michigan Avenue would be inconsistent with the adjacent single-family land uses.

Implementation of the East Option could spur economic revitalization and the development of more livable, transit-supportive communities near the proposed stations. More foot traffic near stations would benefit local businesses and encourage community development.

Mitigation - The following mitigation measures would offset the potentially adverse impacts:

- Land for parking facilities would be rezoned, and the facilities would include landscaping and lighting that is compatible with adjacent land uses. Garages would have architectural design and massing (setting back the upper floors away from the edge of the property to shield them from view from the street) that would reduce incompatibilities with adjacent land uses.

- Land for the substation would be rezoned, and the facility would include landscaping and architectural design and massing that would be compatible with adjacent land uses.

Construction Impacts

Construction would take up to 5 years, and would cause temporary impacts such as noise, vibration, fugitive dust, truck traffic, and roadway detours. There could be short-term economic benefits due to jobs created by construction. Construction could be disruptive to businesses along the alignment, which would be an adverse impact.

Mitigation - To minimize the adverse impact, CTA would work with the community, businesses, aldermen's offices, and the Chicago Department of Planning and Development to develop and implement a Construction Outreach and Coordination Plan. The plan would include a Business Outreach Program to assist local businesses and residents affected by construction. The plan would be tailored to business and community needs, and would include a series of initiatives to minimize construction disruption to businesses and the surrounding community. Examples of these initiatives include a community calendar to inform residents of the construction schedule and avoid affecting special events or festivals, advertising campaigns, any provisions for additional parking during construction, signage, and other economic incentives or tax relief measures for businesses adversely affected by construction.

Impacts Remaining After Mitigation

No permanent or construction-related adverse land use or economic impacts would remain after mitigation.

4.1.3.3 Union Pacific Railroad Alternative - West Option

Permanent Impacts

Like the East Option, the West Option would cause displacements as a result of construction of the track structure and park & ride facilities (see **Section 4.2**). The proposed Michigan Avenue station parking structure would have ground-floor retail and community facility space, which could help offset the land use and economic impacts of displacements. The following potentially adverse impacts would occur:

- The introduction of an elevated track structure in Fernwood Parkway would alter the open space's function as a buffer between the UPRR freight tracks and the single-family neighborhood on the west side of Eggleston Avenue.

- The park & ride facilities at the 103rd Street, 111th Street, and Michigan Avenue stations would be inconsistent with adjacent land uses, and zoning designations do not permit large, stand-alone surface parking lots or garages.

- The substation just north of Michigan Avenue would be inconsistent with the adjacent single-family land uses.

Like the East Option, the West Option could spur economic revitalization and the development of more livable, transit-supportive communities near the proposed stations. Many of the displacements related to the West Option would be industrial land uses, which could be relocated onto nearby vacant land.

Mitigation - The following mitigation measures would minimize and offset the potentially adverse impacts:

- CTA would plant additional trees on both sides of Eggleston Avenue to minimize visual impacts from the elevated track structure in Fernwood Parkway.
- Land for parking facilities would be rezoned, and the facilities would include landscaping and lighting that is compatible with adjacent land uses. Garages would have architectural design and massing that would be compatible with adjacent land uses.
- Land for the substations would be rezoned, and the facility would include landscaping and architectural design and massing that would be compatible with adjacent land uses.

Construction Impacts

Construction impacts and mitigation measures would be similar to those described for the East Option in **Section 4.1.3.2**.

Impacts Remaining After Mitigation

No permanent or construction-related adverse land use or economic impacts would remain after mitigation.

4.2 Displacements and Relocation of Existing Uses

Displacements and relocations may occur when land and/or structures are needed to accommodate construction or the permanent footprint of a project. This section describes the displacement and relocation impacts of the East and West Options. Displacements would occur if land and/or a structure were needed to accommodate construction or the permanent footprint (right-of-way) of the project. Displaced residents and businesses would be relocated in accordance with the Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970, as amended ("Uniform Act," 42 USC § 4601, et seq.) The *Displacements and Relocation of Existing Uses Technical Memorandum* (**Appendix K**) includes additional details. **Table 4-2** summarizes the displacements and relocation impact findings.

Table 4-2: Displacements and Relocation of Existing Uses - Impacts Summary

Alternative	Total Affected Parcels	Building Displacements	Permanent Impacts	Construction Impacts
No Build	0	0	No impacts	No impacts
Union Pacific Railroad - East Option	260	106	Impacts would not be adverse after mitigation	No impacts
Union Pacific Railroad - West Option	205	46	Impacts would not be adverse after mitigation	No impacts

4.2.1 Regulatory Framework/Methods

The Uniform Act (42 USC § 4601, et seq.) mandates that relocation services and payments be made available to eligible residents, businesses, and non-profit organizations displaced as a direct result of any project undertaken by a federal agency or with federal financial assistance. The Illinois Eminent Domain Act supports the Uniform Act and is the state regulation related to procedures for acquiring property through eminent domain, with similar provisions for reimbursements and relocation as the Uniform Act. The Metropolitan Transit Authority Act (70 Illinois Compiled Statutes [ILCS] § 3605(10)) provides CTA with the authority to use eminent domain to acquire property.

While there are no specific NEPA thresholds for assessing displacement impacts, the Uniform Act and the Uniform Real Property Acquisition Policy (42 USC § 4651, et seq.) include provisions for uniform and equitable treatment of people displaced from their homes or businesses by establishing uniform and equitable land acquisition policies to address impacts.

For this Draft EIS, displacements and relocations would cause an adverse impact if they would result in either of the following:

- Displacement of substantial numbers of existing housing units (a concentrated number of units in one neighborhood), particularly affordable housing, and/or employer units, necessitating the construction of replacement units elsewhere. This analysis uses the definition of affordable housing provided by the Illinois Housing Development Authority for the Chicago Metro area, which is based on data provided by the U.S. Department of Housing and Urban Development.

- Displacement of a substantial number of residents or employees, necessitating construction of replacement housing or employment locations elsewhere.

CTA used the following steps to determine whether each option would cause adverse displacement and relocation impacts:

- CTA prepared counts and locations of private property acquisitions and building displacements using the plan and profile drawings (**Appendix F**), CMAP and City of Chicago geographic information system parcel data, Cook County Assessor data, Google Earth, and aerial photographs. The plans and profiles are based on conceptual engineering and will be subject to revision in future engineering phases. Impacts presented in this section are based on conceptual engineering and represent maximum potential impacts for the East and West Options. Impacts will be confirmed in the Final EIS.

- CTA performed site reconnaissance of the project area and field observation of parcels and buildings to confirm the data. CTA assessed impacts of the potential acquisitions on the surrounding properties and community areas.

- CTA evaluated properties in the project area to determine whether vacancies would be sufficient to accommodate relocation of displaced residents and businesses nearby. CTA conducted qualitative field observations to determine the character of each affected community area and the ability of each to absorb temporary and permanent losses in residential and commercial units.

The following terms are used to describe displacements and relocation impacts in this section:

- Affected Parcel - A partial or a full parcel that would need to be acquired
- Building Displacement - A structure that would need to be removed (the land occupied by the structure would also be counted as an affected parcel)

Publicly owned parcels that *include a roadway* are classified as "easements" for this analysis because CTA would require a use agreement with the public entity. CTA will coordinate with FHWA, IDOT, CDOT, and Cook County regarding use of these parcels. Publicly owned parcels that *do not include a roadway* are classified as affected parcels or building displacements because CTA would need to negotiate a fee simple property transfer or other agreement with the public entity.

4.2.2 Existing Conditions

Along the UPRR Alternative alignment, the existing development pattern consists primarily of single-family residential properties north of I-57 and between 99th Street and the proposed Michigan Avenue station, with some multifamily units interspersed. Between 103rd and 111th Streets, there are several vacant and light industrial properties along the western edge of the corridor. There are also neighborhood-scale commercial retail buildings near the 103rd Street, 111th Street, and Michigan Avenue station sites. South of the proposed Michigan Avenue station location, the land uses around the alignment transition to industrial, vacant, and public utility sites. The Altgeld Gardens public housing project is at the southern end of the alignment, near 130th Street. Most of the neighborhoods along the alignment have at least a few vacant buildings and parcels per block.

CTA conducted a field verification of all potentially displaced properties on March 5, 2015 and July 7–10, 2015. CTA identified numerous houses that were boarded-up and uninhabited, primarily between 105th Street and 115th Street on the east side of the corridor and along Eggleston Avenue from 107th Street to 108th Street on the west side of the corridor.

4.2.3 Environmental Consequences

The following sections summarize the potential displacement and relocation impacts of each alternative. **Appendix K** contains a full list of displacements and detailed maps.

4.2.3.1 No Build Alternative

There would be no displacements or relocations associated with the No Build Alternative. No adverse displacement and relocation impacts would occur, and no mitigation measures would be required.

4.2.3.2 Union Pacific Railroad Alternative - East Option

Permanent Impacts

UPRR requires that, for safety reasons, the CTA tracks be located at least 50 feet from the existing freight tracks. To maintain the required 50-foot distance, the CTA right-of-way would extend into the residential neighborhoods east of the UPRR right-of-way. A total of 260 parcels and 106 buildings would be acquired for the East Option to accommodate the tracks, stations, 120th Street yard and shop, and ancillary facilities. The East Option would displace more properties and buildings than the West Option. The East Option would not displace any affordable housing units (National Housing Preservation Database 2015).

Table 4-3 summarizes the land use types for the potential property and building displacements.

Table 4-3: Union Pacific Railroad Alternative East Option Displacements

Land Use Type	Total Affected Parcels (With and Without Building Displacements)	Building Displacements[1]
Vacant	50	
Single-Family Residential	87	75
Multifamily Residential	16	15
Commercial	6	3
Mixed-Use Commercial/Residential	1	1
Institutional (Place of Worship)	1	1
Institutional (School)	2	
Industrial	17	10
Utility (MWRD)	15	
Transportation (Union Pacific Railroad)	19	
Transportation (CN/ME)	3	
Transportation (Norfolk Southern Railway)	2	
Transportation (Conrail)	3	
Transportation (NICTD/CSS & SBRR)	2	
Public (City of Chicago)	34	1
Parkland	2	
Totals	**260**	**106**

MWRD = Metropolitan Water Reclamation District of Greater Chicago, CN/ME = Canadian National/Metra Electric District, Conrail = Consolidated Rail Corporation, NICTD/CSS & SBRR = Northern Indiana Commuter Transportation District/Chicago South Shore & South Bend Railroad

[1] Building displacements are a subset of affected parcels and relate to a primary building displacement and/or an auxiliary structure (such as a garage) displacement. Building displacements are based on conceptual engineering that would be subject to revision during future design phases. Easements are not included in this table.

Figure 4-3 and **Figure 4-4** show the locations of the potential property and building displacements. **Appendix K** contains detailed information and maps of the potentially displaced properties. Displacements would occur for the following reasons:

- **99th Street to 103rd Street** - Twenty-six buildings, mostly single-family residential properties, would be removed to accommodate the right-of-way from 99th Street to 103rd Street, including the 103rd Street station and park & ride facilities.

- **103rd Street to 111th Street** - Eighteen buildings, mostly single-family residential properties with some industrial properties, would be removed to accommodate the right-of-way from 103rd Street to 111th Street, including the 111th Street station, park & ride facility, and substation.

- **111th Street to 115th Street** - Twenty-eight buildings, mostly single-family residential properties, multifamily residential properties, and industrial properties, would be removed to accommodate the right-of-way from 111th Street to 115th Street. One place of worship would also be displaced.

- **115th Street to the CN/ME Tracks near 119th Street** - Thirty-three buildings would be removed to accommodate the right-of-way from 115th Street to 117th Street. Most of the displacements would result from the Michigan Avenue station park & ride facility. Displacements would consist primarily of single-family residential and multifamily residential properties as well as two industrial buildings.

- **120th Street Yard and Shop** - The 120th Street yard and shop would require removal of one industrial building.

- **Easements** - At the north end of the project area, a total of 21 easements would be required to accommodate the East Option in the I-57 right-of-way and at the crossing of I-57 where the tracks would curve south. Five easements would also be required from 115th Street to 117th Street.

Figure 4-4: Union Pacific Railroad Alternative East Option Displacements (2 of 2)

Although the East Option would displace more buildings than the West Option, most of the displacements would be spread evenly along the corridor between 99th Place and the Michigan Avenue station. On most affected blocks, one or two houses at the end of each street adjacent to the UPRR tracks would be removed. Because the displacements would be spread evenly along the corridor, most neighborhoods would not experience a substantial concentration of displacements. The only area with a high concentration of displacements would be the block bounded by the UPRR right-of-way, State Street, 116th Street, and Michigan Avenue, where the Michigan Avenue station park & ride facility would be constructed; 30 properties would be displaced on that block. Of the 260 properties that the East Option would displace, 50 parcels are vacant. In addition, 33 of the 34 parcels owned by the City of Chicago that would be affected by the East Option are vacant. The vacant properties are dispersed throughout the corridor primarily between 99th Street and Prairie Avenue.

The East Option would affect portions of Wendell Smith Park and Block Park (4.7 acres and 1.3 acres, respectively). Of the 4.7 acres of Wendell Smith Park, approximately 0.7 acre would be overlapped by the elevated structure and its associated clearances. Of the 1.3 acres of Block Park, approximately 0.9 acre of park space would be overlapped by the elevated structure and its associated clearances. Additional information about impacts on these parks is presented in **Chapter 8**. A communications tower owned by the City of Chicago is located in Block Park and would be affected by the East Option.

CTA conducted a field verification of potentially displaced properties and availability of replacement housing, commercial buildings, and vacant parcels on March 5, 2015 and July 7–10, 2015. CTA identified numerous houses that were boarded-up and uninhabited throughout the community, primarily between 105th Street and 115th Street on the east side of the corridor and along Eggleston Avenue from 107th Street south on the west side of the corridor. At the time of the field verification, three of the residential displacements identified for the East Option were boarded up, and are not likely to adversely affect a resident.

Mitigation - The availability of replacement housing, commercial buildings, and vacant parcels would likely allow relocation of displaced businesses and residents within the project area. In addition, the new multilevel parking garage at the Michigan Avenue station would have ground-floor retail and community facility space, which would help offset displacements. The new stations would improve regional accessibility and help attract new development to the area, thereby reducing the long-term impacts of displacements. With mitigation through fair compensation and relocation assistance per the Uniform Act (42 USC § 4601, et seq.), impacts would not be adverse. CTA would coordinate with the Chicago Department of Planning and Development on local economic development and community plans during future design phases. CTA has undertaken early outreach to all potentially affected property owners by contacting each owner and lessee (based on available public records). CTA's Uniform Act public outreach specialists would provide specific outreach as a one-stop resource to potentially displaced residents and/or businesses to answer questions regarding relocation rights, requirements, processes, and anticipated timelines. CTA, in coordination with the City of Chicago and the local aldermen's offices, would provide informational resources, permitting support, and points of contact for displaced business owners to find suitable sites for relocation. CTA would coordinate with the City of Chicago regarding impacts on the communications tower and potential relocation options.

Construction Impacts

Because all construction activities would occur within the street right-of-way or on land permanently acquired for the permanent right-of-way, yard and shop, and park & ride facilities, there would be no temporary construction-related displacement or relocation impacts.

Impacts Remaining After Mitigation

With mitigation through fair compensation and relocation assistance per the Uniform Act (42 USC § 4601, et seq.), impacts would not be adverse after mitigation. No temporary, construction-related adverse displacement and relocation impacts would occur under the East Option.

4.2.3.3 Union Pacific Railroad Alternative - West Option

Permanent Impacts

Like the East Option, the West Option would be subject to the UPRR requirement that the CTA elevated structure be constructed at least 50 feet from the existing freight tracks. In the West Option, however, the CTA elevated structure would run along the west side of the UPRR right-of-way, where fewer buildings are present. As a result, the West Option would result in 46 displaced buildings, compared to 106 for the East Option, and more of the displaced buildings would be industrial and commercial rather than single-family residential, due to the predominance of industrial land uses along the west side of the UPRR right-of-way. The 46 buildings that would be removed are part of the 205 parcels that would be acquired for the West Option to accommodate the tracks, stations, 120th Street yard and shop, and ancillary facilities. The West Option would not displace any affordable housing units (National Housing Preservation Database 2015). **Table 4-4** summarizes the land use types for the potential property and building displacements.

Table 4-4: Union Pacific Railroad Alternative West Option Displacements

Land Use Type	Total Affected Parcels (With and Without Building Displacements)	Building Displacements[1]
Vacant	41	
Single-Family Residential	35	22

[1] Building displacements are a subset of affected parcels and relate to a primary building displacement and/or an auxiliary structure (such as a garage) displacement. Building displacements are based on conceptual engineering that would be subject to revision during future design phases. Easements are not included in this table.

Figure 4-5 and **Figure 4-6** show the locations of the potential property and building displacements. **Appendix K** contains detailed information and maps of the potentially displaced properties. Displacements would occur for the following reasons:

- **99th Street to 103rd Street** - The CTA elevated structure would be located above much of Fernwood Parkway between 99th and 103rd Streets. Park impacts are discussed further as part of the Section 4(f) analysis in **Chapter 8**. One multifamily residential property and one commercial building would be removed to accommodate the 103rd Street station.

- **103rd Street to 111th Street** - Nine buildings, all industrial and commercial, would be removed to accommodate the permanent right-of-way from 103rd Street to 111th Street.

- **111th Street to 115th Street** - Eight buildings would be removed to accommodate the permanent right-of-way between 111th Street and 115th Street. Displacements would include a mix of residential, commercial, and industrial buildings.

- **115th Street to the CN/ME Tracks near 119th Street** - Twenty-six buildings would be displaced to accommodate the right-of-way from 115th Street to 117th Street. Most of the displacements would result from the Michigan Avenue station park & ride facility. Displacements would consist primarily of single-family residential and multifamily residential properties. One place of worship and one industrial building would also be displaced.

- **120th Street Yard and Shop** - The 120th Street yard and shop would require removal of one industrial building.

- **Easements** - At the north end of the project area, a total of 23 easements would be required to accommodate the West Option in the I-57 right-of-way and at the crossing of I-57 where the tracks would curve south. One easement would also be required from 115th Street to 117th Street.

Figure 4-6: Union Pacific Railroad Alternative West Option Displacements (2 of 2)

Displacements would be spread evenly along the corridor between 103rd Street and the Michigan Avenue station. Many of the displacements would be industrial land uses, which could be relocated to nearby vacant parcels and buildings or within nearby industrial corridors. Most of the affected residential blocks would be between 111th Street and the Michigan Avenue station. On most of these blocks, one or two houses at the end of each street adjacent to the UPRR tracks would be removed. Because the displacements would be spread evenly along the corridor, most neighborhoods would not experience a substantial concentration of displacements. The only area with a high concentration of displacements would be the block bounded by the UPRR right-of-way, State Street, 116th Street, and Michigan Avenue, where the Michigan Avenue station park & ride facility would be constructed; 30 parcels would be displaced on this block. Of the 205 properties that the West Option would displace, 41 parcels are vacant. In addition, all 24 of the City of Chicago parcels that would be affected by the West Option are vacant. The vacant properties are dispersed throughout the corridor primarily between 99th Street and Prairie Avenue.

The West Option would affect Fernwood Parkway. Approximately 2.9 acres of Fernwood Parkway lies within the project corridor, and approximately 1.9 acres of the parkway would be overlapped by the elevated structure and its associated clearances. **Chapter 8** provides additional information about impacts on Fernwood Parkway.

CTA conducted a field verification of potentially displaced properties and availability of replacement housing, commercial buildings, and vacant parcels on March 5, 2015 and July 7–10, 2015. CTA identified numerous houses that were boarded-up and uninhabited throughout the community, the majority of which were between 105th Street and 115th Street on the east side of the corridor and along Eggleston Avenue from 107th Street south on the west side of the corridor. At the time of the field verification, one of the residential displacements identified for the West Option was boarded up, and is not likely to adversely affect a resident.

Mitigation - The availability of replacement housing, commercial buildings, and vacant parcels would likely allow relocation of displaced businesses and residents within the project area. In addition, the new multilevel parking garage at the Michigan Avenue station would have ground-floor retail and community facility space, which would help offset displacements. The new stations would improve regional accessibility and help attract new development to the area, thereby reducing the long-term impacts of displacements. With mitigation through fair compensation and relocation assistance per the Uniform Act (42 USC § 4601, et seq.), impacts would not be adverse. CTA would coordinate with the Chicago Department of Planning and Development on local economic development and community plans during future design phases. CTA would provide specific outreach as a one-stop resource to potentially displaced residents and/or businesses.

Construction Impacts

Because all construction activities would occur within the street right-of-way or on land permanently acquired for the permanent right-of-way, yard and shop, and park & ride facilities, there would be no temporary construction-related displacement or relocation impacts.

Impacts Remaining After Mitigation

With mitigation through fair compensation and relocation assistance per the Uniform Act (42 USC § 4601, et seq.), impacts would not be adverse after mitigation. No temporary, construction-related adverse displacement and relocation impacts would occur under the West Option.

4.3 Neighborhoods and Communities

This section describes the project impacts on the surrounding neighborhood and community resources. The analysis considered the surrounding community context and character, community mobility, and community facilities near the project corridor, such as schools, parks, and community centers. The *Neighborhood and Community Impacts Technical Memorandum* (**Appendix L**) and the *Parklands and Community Facilities Technical Memorandum* (**Appendix M**) contain additional details. **Table 4-5** summarizes the impact findings for community character and cohesion, mobility, and community resources.

Table 4-5: Neighborhoods and Communities - Impacts Summary

Alternative	Permanent Impacts			Construction Impacts
	Community Character and Cohesion	Mobility	Community Resources	
No Build	No impacts	No impacts	No impacts	No impacts
Union Pacific Railroad - East Option	▪ Washington Heights and Riverdale - Impacts would not be adverse after mitigation ▪ Roseland and West Pullman - Adverse impacts despite mitigation because of adverse visual impacts	Benefits	▪ Roseland - Impacts would not be adverse after mitigation ▪ Washington Heights, West Pullman, and Riverdale - Benefits	Impacts would not be adverse after mitigation
Union Pacific Railroad - West Option	▪ Riverdale - Impacts would not be adverse after mitigation ▪ Roseland, Washington Heights, and West Pullman - Adverse impacts despite mitigation because of adverse visual impacts	Benefits	▪ Roseland, Washington Heights, and Riverdale - Benefits ▪ West Pullman - Impacts would not be adverse after mitigation	Impacts would not be adverse after mitigation

4.3.1 Regulatory Framework/Methods

FHWA and IDOT both have Community Impact Assessment Manuals (FHWA 2008, IDOT 2007a), which CTA used to look at potential neighborhood and community impacts of the East and West Options. The analysis considers the following types of impacts:

- **Community Character and Cohesion** - Impacts due to commercial and residential displacements and changes in land use, visual/aesthetics, noise levels, and population/demographics. Community character is an attribute of a geographic area with identifiable characteristics that make it unique. Community cohesion is an attribute of a geographic area, where segmentation or division of the area would reduce its desirability to current and future residents. For this Draft EIS, an impact on community character and cohesion would be adverse if impacts related to displacements and changes in land use, visual/aesthetics, noise levels, and population/demographics would be adverse, as discussed throughout this chapter of the Draft EIS.

- **Mobility** - Overall community impacts of changes in transportation options, travel patterns, business activity, access to jobs, and access for emergency service providers. For this Draft EIS, an impact on mobility would be adverse if transportation options, access to jobs, and access for emergency service providers would be reduced.

- **Community Resources** - Impacts on key facilities in the project area that play an important role in shaping and defining the community, such as landmarks, parks, community centers, and other places that serve as focal points or provide community services. For this Draft EIS, an impact on community resources would be adverse if key facilities in the project area would be directly affected or access to key facilities would be reduced.

The neighborhood and community impact analysis involved creating detailed demographic and community profiles based on existing community area boundaries within ½ mile of the project alignments. CTA conducted field investigations to identify physical, social, or perceived barriers within the established community. In addition, the analysis considered other potential visual, noise, and environmental impacts that could have ripple effects on the surrounding neighborhood. Potential mitigation measures are proposed to offset identified impacts, with an emphasis on community and transit-supportive solutions to address temporary construction impacts.

4.3.2 Existing Conditions

The affected environment for the neighborhood and community impacts analysis consists of the community areas through which the East or West Option alignment would pass. Each community area through which the East or West Option alignment would pass is described below. The *Neighborhood and Community Impacts Technical Memorandum* (**Appendix L**) contains additional information about each community area. **Figure 4-7** shows a typical street in the project area, and **Figure 4-8** shows the locations of the referenced community areas.

Figure 4-7: Photo of Residential Street near Union Pacific Railroad Corridor in Roseland

- Roseland - Consists primarily of single-family homes along one-way streets with block associations, similar to Washington Heights. Michigan Avenue serves as a major retail and commercial corridor, and several blocks also contain single-family and multifamily housing. Within Roseland, the greatest amount of retail activity occurs between 111th and 115th Streets, with the areas to the north consisting of automobile-oriented land uses.

- Washington Heights - Consists primarily of single-family homes along a grid of one-way streets with low- to medium-density commercial areas with off-street parking along major arterial streets. Blocks are well maintained, and many have community-organized block associations that provide neighborhood watch programs and other initiatives.

Figure 4-8: Community Areas in the Project Area and Community Resources Affected by Union Pacific Railroad Alternative East or West Options

- West Pullman - Includes portions of the Michigan Avenue commercial corridor, as well as several large industrial and utility properties. Along Michigan Avenue, many commercial buildings have residential units above. Several Spanish-speaking businesses and households are also in the area.

- Riverdale - Much of the Riverdale community area is occupied by MWRD's facility and freight railroad properties. The southern portion of Riverdale contains the Altgeld Gardens public housing project and the single-family Eden Green and Golden Gate neighborhoods. There are relatively few household-serving businesses in the area; however, Altgeld Gardens does have some of its own services, such as a school, social services, and medical facilities.

The demographic characteristics in the project area are described in detail in **Appendix L** and are summarized below (US Census Bureau 2010, 2013).

- The project area contains approximately 128,400 residents, 44,600 households, and 11,100 jobs; the numbers of all of these have been shrinking throughout recent decades. The disparity between the number of residents and jobs reflects high unemployment in the project area (19.0 percent), and a large number of residents commuting outside of the project area for work.

- Ethnicity in the project area is predominantly African American (93 percent), with the next largest percentage (4 percent) being Hispanic. All community areas in the project area have African American population percentages ranging from 83.6 percent to 97.3 percent, compared with a citywide average of 32.4 percent.

- The population is predominantly English-speaking, with some pockets of households that speak only Spanish.

- Median household income in the project area is approximately $41,000, compared to $46,900 for the City of Chicago as a whole. Some census tracks in the Riverdale community area have very low median household incomes, ranging from $2,500 to $18,000.

- Median home prices range from $75,200 in Riverdale to $113,500 in Morgan Park, which is below the City of Chicago median of $161,000.

Within ½ mile of the East and West Option alignments are 70 religious facilities, 21 public schools (including 1 charter school), 10 daycares, 7 private schools, 8 community centers, 4 healthcare centers, 2 city facilities, 2 senior centers, 1 landmark, and 1 library. In addition, the Altgeld Gardens public housing development is just southwest of the proposed 130th Street station location. The *Neighborhood and Community Impacts Technical Memorandum* (**Appendix L**) contains a full listing of the community resources, emergency services, and schools in the project area. The *Parklands and Community Facilities Technical Memorandum* (**Appendix M**) contains a full listing of the parks and other community facilities in the project area.

Wendell Smith Park is in Roseland and is approximately 4.7 acres (340 feet wide by 610 feet long). This park is an actively used facility with basketball courts, baseball fields, a play lot, recreation building, and 0.3 mile of walking trails. Regularly scheduled activities at Wendell Smith Park include basketball tournaments, baseball/softball games, and concerts. The park is also actively used by day camps and for activities organized by the Chicago Park District.

Block Park is in Roseland and is a passive green space. Harvard Avenue divides Block Park into two parcels. The east parcel is approximately 1.4 acres (130 feet wide by 460 feet long) and includes amenities such as benches, walking paths, and sidewalks. The west parcel is approximately 1.3 acres (90 feet wide by 600 feet long) and is open space with a sidewalk and no other park amenities. In addition, a communications tower and two utility structures are on the west parcel.

Fernwood Parkway is in Roseland and is a passive green space. The parkway is divided into two parcels by 101st Street. The north parcel, from 99th Street to 101st Street, is approximately 2.4 acres (78 feet wide by 1,325 feet long). The south parcel, from 101st Street to 103rd Street, is approximately 2.9 acres (78 feet wide by 1,277 feet long). Both the north and south parcels of Fernwood Parkway serve as open space and do not contain recreational facilities or amenities such as sidewalks or benches. Some trees are planted within the parkway and a chain-link fence separates the green space from the existing at-grade UPRR tracks.

4.3.3 Environmental Consequences

The following sections summarize the potential neighborhood and community impacts of each alternative.

4.3.3.1 No Build Alternative

Under the No Build Alternative the project would not be built, and there would be no changes to community character and cohesion. The No Build Alternative would lack the mobility and livability enhancements that the East and West Options would provide. It would also fail to address the community's desire for growth initiatives that could attract new economic development interests to the area. There would be no impacts on community resources. Construction would not occur under the No Build Alternative. The No Build Alternative would not have adverse community or neighborhood impacts, and no mitigation measures would be required.

4.3.3.2 Union Pacific Railroad Alternative - East Option

Permanent Impacts

Community Character and Cohesion

The East Option alignment would be within existing highway rights-of-way and adjacent to the UPRR and NICTD/CSS & SBRR freight rail corridors. The elevated structure would not substantially differ from the existing character of the freight railroad tracks, but would encroach into the residential neighborhood and would be more prominent than the freight railroad tracks due to its height. The structure would not introduce new separations between neighborhoods, because the UPRR right-of-way already has limited grade crossings and acts as a barrier for pedestrians. The East Option would require more displacements than the West Option (see **Section 4.2**), particularly in Roseland and West Pullman.

The new transit stations would become focal points for the surrounding communities, and may attract new commercial and residential activities that would result in an overall improvement in community character. The increased pedestrian activity around stations may help bridge the gap between communities currently separated by the freight tracks. The multistory park & ride facility at the Michigan Avenue station would include a ground-floor community facility and retail space, which would serve as a community enhancement.

The following permanent adverse impacts related to community character and cohesion would occur:

- Displacements and Relocation of Existing Uses
    - The placement of the track structure in Roseland would require acquisition of the two or three parcels closest to the eastern side of the UPRR right-of-way on every east-west street from 99th Place to 102nd Place and from 105th Place to Michigan Avenue. Most of these parcels contain single-family homes. Because the streets in this area, with the exception of major thoroughfares, end at the UPRR right-of-way, the displaced homes would be at the ends of blocks (adjacent to the UPRR tracks), and not in the center of the neighborhood. The CTA track structure would encroach on the edges of neighborhoods, but would leave the neighborhoods otherwise intact.
    - A total of 18 buildings would be removed to accommodate the Michigan Avenue station park & ride facility in West Pullman. Of the 18 buildings, 16 are residential, 1 is commercial, and 1 is industrial.
- Visual and Aesthetic Conditions
    - The elevated track structure would cause adverse visual impacts because of the change in the visual setting in the highway right-of-way along the north side of I-57 in Roseland, as shown in **Figure 4-14** in **Section 4.3.3.2**.
    - The track structure near the intersection of 117th Street and Prairie Avenue in West Pullman would displace two houses and extend into the neighborhood beyond the line of trees that currently shields view of the UPRR right-of-way. Four houses would face the structure, and the height would be out of scale with the existing character of the neighborhood. The structure's location above an intersection would make it impossible to minimize visual impacts from it with additional trees, as shown in **Figure 4-15** in **Section 4.4.3**.
- Noise
    - The noise from CTA trains combined with existing UPRR freight trains would cause adverse impacts at noise-sensitive buildings in Roseland, Washington Heights, and West Pullman. The UPRR train frequency is 27 trains per day and the headways (time between trains) for CTA trains would range from 3–6 minutes during peak periods to 15 minutes at night.

Mitigation - Mitigation measures to minimize adverse permanent impacts related to community character and cohesion would include the following:

- Displacements and Relocation of Existing Uses - CTA would provide compensation for displacements and relocation assistance in compliance with the Uniform Act (42 USC § 4601, et seq.), which would offset the neighborhood and community impacts of displacements because sufficient replacement housing, commercial buildings, and vacant parcels exist in the immediate area to accommodate affected residents and businesses.

- Visual and Aesthetic Conditions - Mitigation measures, as described in **Section 4.4.3**, would reduce the adverse visual impacts north of I-57 and near 117th Street and Prairie Avenue. Due to the proximity of the elevated track structure to residential areas, the impacts would remain adverse despite mitigation.

- Noise - CTA would build noise barriers approximately 4 feet in height along the sides of the track structures where needed to avoid adverse noise impacts (see **Section 4.5**).

Mobility
The East Option would substantially reduce travel times between the Washington Heights, Roseland, West Pullman, and Riverdale communities, and would enhance their connection with major employment and activity centers north of the project area. The East Option would result in substantial mobility benefits for Far South Side residents.

Community Resources
The East Option would displace the Now Faith Church of God Holiness (135 W. 114th Street), and would cross portions of Wendell Smith Park and Block Park, all in Roseland (see **Figure 4-8**).

The East Option alignment would run through the northwestern corner of the Wendell Smith Park. Of the 4.7 acres of the park, approximately 0.7 acre would be overlapped by the elevated structure and its associated clearances. The overlap area includes open space, trees, benches, and a portion of the park's walking trail. The outfield of an existing baseball field would be used. Piers would be located in the park, and the bottom of the elevated structure would be approximately 15 feet above ground level.

The East Option alignment would run through the west parcel of Block Park. Of the 1.3 acres of the west parcel of the park, approximately 0.9 acre would be overlapped by the elevated structure and its associated clearances. An auxiliary station entrance would also be located in the park, along its western edge. The affected parcel includes an isolated portion of the park's open space and a communications tower; no recreational features would be affected.

The East Option alignment would displace two parcels associated with the Kwame Nkrumah Academy at 314 W. 108th Street. The school building would not be affected, but a portion of the schoolyard would be displaced.

The new rail extension would facilitate access to community resources near the station locations, especially for transit-dependent residents, which would be beneficial overall. The RLE would provide direct transit access for residents of and visitors to Altgeld Gardens. The following permanent adverse impacts on community resources would occur:

- The elevated track structure would pass through the western portion of Wendell Smith Park in Roseland, requiring relocation of a portion of the park's walking trail.

- The elevated track structure and part of the 103rd Street station would be located in the western portion of Block Park in Roseland. The affected portion of the park contains a communications tower and no active recreational features.

- The Now Faith Church of God Holiness would be displaced.

Mitigation - Mitigation measures to minimize adverse permanent impacts on community resources would include the following:

- CTA could keep the area beneath the track structure in Wendell Smith Park and Block Park open for use, and improve park space elsewhere in the neighborhood.

- CTA would plant new trees to shield views of the structure from homes fronting Wendell Smith Park.

- In accordance with the Uniform Act (42 USC § 4601, et seq.), CTA would provide assistance for the relocation of the Now Faith Church of God Holiness to another building or parcel in the surrounding area.

Impacts on parks and proposed mitigation measures, as well as further details on coordination with the Chicago Park District to confirm park-related mitigation measures, are described in **Chapter 8** of this Draft EIS.

Construction Impacts

Community Character and Cohesion

Community disruptions would occur during construction of the East Option. Construction would be phased and would not occur at any one location for the entire construction period. Most of the construction would occur within the street right-of-way, on properties acquired as part of the permanent envelope for the project, and potentially on other nearby vacant parcels.

The following temporary construction-related adverse impacts on community character and cohesion would occur:

- Hoisting equipment might be visible above roofs, and storage of materials, equipment, and trucks would introduce temporary intermittent visual impacts.

- Temporary noise and dust impacts would occur during construction on an intermittent basis.

Mitigation - Mitigation measures to offset adverse temporary construction-related impacts on community character and cohesion would include the following:

- Construction best management practices (BMPs) would be used to limit visual, noise, and dust impacts. Examples of these BMPs include maintaining vegetation at the construction site to minimize visual impacts, limiting nighttime construction, and preparation of a Dust Control Plan to address in detail how dust would be controlled at the construction site.

- Hauling routes would be designed to minimize the number of trucks and amount of equipment passing through sensitive areas of the community, and would favor highways over local roads to the extent feasible.

- CTA would notify the community in advance of disruptive activities, such as building demolition, utility relocation, and necessary detours, and would perform work in a manner consistent with local ordinances.

- CTA would limit nighttime construction near residences to the extent practicable.

- CTA would phase construction activities to minimize impacts on CTA operations at the 95th Street Terminal and 98th Street Yard and Shop, as well as on vehicular traffic on affected expressways and roadways, minimizing disruptions to community members' day-to-day lives.

- CTA would work with the community, businesses, aldermen's offices, and the Chicago Department of Planning and Development to develop and implement a Construction Outreach and Coordination Plan, as described in **Section 4.1.3.2**.

Mobility
During construction of the UPRR Alternative, temporary closures of streets crossing the alignment might be required. Detours would be provided to maintain emergency access and access to adjacent properties, and bus service would detour around closures.

The following temporary construction-related adverse impacts on mobility would occur:

- Truck traffic would increase in the project area. Temporary street closures and detours would be needed. Lane closures, temporary parking restrictions, and temporary conversion of two-way streets to one-way streets might also be implemented.

- Access to businesses near construction sites could be temporarily limited on an intermittent basis due to construction-related detours and closures.

Mitigation - Mitigation measures to offset adverse temporary construction-related mobility impacts would include the following:

- CTA would provide adequate detours around construction sites and would minimize road and lane closures to the extent possible.

- CTA would provide a temporary advertising program to increase the visibility of adversely affected businesses during construction, for example, by providing signs that say "We Are Open" and explaining changes in access for business patrons, or by placing notifications on CTA trains and buses encouraging customers to continue to support the businesses affected by construction.

Community Resources
Construction may temporarily limit access to community resources and parks. The following adverse impacts on community resources would occur:

- Community resources adjacent to the alignment would be subject to the same impacts identified above, under "Community Character and Cohesion" and "Mobility."
- Construction activities would be required in Wendell Smith Park and Block Park in Roseland. The northwest portion of Wendell Smith Park and the west portion of Block Park would be inaccessible during construction activities.
- Access to community resources near the construction areas may be temporarily disrupted by street closures and detours.

Mitigation - Mitigation measures to offset adverse temporary construction-related impacts on community resources would include the following:

- CTA would schedule major construction activities to minimize conflicts with community events to the extent possible.
- CTA would maintain access to community resources during construction, via detours when necessary.
- CTA would coordinate with the community to avoid adverse impacts on the function of Wendell Smith Park. Nearby alternate parks, such as Robert Abbott Park and Fernwood Park, would remain available for use during construction in Wendell Smith Park.

Impacts Remaining After Mitigation

The East Option would have a permanent adverse impact on community character and cohesion that could not be mitigated, due to the visual encroachment of the elevated structure into the neighborhood north of I-57 in Roseland and at 117th Street and Prairie Avenue in West Pullman. Other permanent impacts related to neighborhoods and communities would not be adverse after implementation of mitigation measures.

Construction-related impacts on neighborhoods and communities would not be adverse after implementation of the proposed mitigation measures.

4.3.3.3 Union Pacific Railroad Alternative - West Option

Permanent Impacts

Community Character and Cohesion

Like the East Option alignment, the West Option alignment is within existing highway rights-of-way and adjacent to the UPRR and NICTD/CSS & SBRR freight rail corridors. The elevated structure would not substantially differ from the existing character of the freight railroad tracks, but would encroach into the residential neighborhood and would be more prominent than the freight railroad tracks due to its height. The structure would not introduce new separations between neighborhoods because the UPRR right-of-way already has limited grade crossings and acts as a barrier for pedestrians. The West Option would require fewer displacements than the East Option (see **Section 4.2**), particularly in Roseland and West Pullman.

The new transit stations would become focal points for the surrounding communities, and may attract new commercial and residential activities that would result in an overall improvement in community character. The increased pedestrian activity around stations may help bridge the gap between communities currently separated by the freight tracks. The multistory park & ride facility at the Michigan Avenue station would include a ground-floor community facility and retail space, which would serve as a community enhancement.

The following permanent adverse impacts related to community character and cohesion would occur:

- Displacements and Relocation of Existing Uses
  - The placement of the track structure would require acquisition of parcels along the west side of the UPRR right-of-way between 103rd Street and the Michigan Avenue station in Roseland and West Pullman. The parcels, some of which are vacant or sparsely occupied, primarily contain a mix of industrial and residential uses. Because the streets in this area, with the exception of major thoroughfares, end at the UPRR right-of-way, the displaced parcels would be at the ends of blocks (adjacent to the UPRR tracks), and not in the center of the neighborhood. The CTA track structure would encroach on the edges of neighborhoods, but would leave the neighborhoods otherwise intact.
  - A total of 17 buildings would be removed to accommodate the Michigan Avenue station park & ride facility in West Pullman. Of the 17 buildings, 16 are residential and 1 is commercial.
- Visual and Aesthetic Conditions
  - The elevated track structure would cause adverse visual impacts because of the change in the visual setting in the highway right-of-way north of I-57 in Roseland, as shown in **Figure 4-14** in **Section 4.3.3.2**.
  - Between 99th and 103rd Streets, the elevated structure would run through Fernwood Parkway in Washington Heights. The introduction of the new elevated structure and 103rd Street station would visually change the setting of the parkway and the houses facing it along the west side of Eggleston Avenue. Although the recreational impact on the parkway could be offset, the change in visual community character could not be mitigated. **Figure 4-9** shows the view along Eggleston Avenue and Fernwood Parkway facing 103rd Street, including the existing view (top) and a photo simulation of the West Option (bottom) at the same location.
  - The construction of the Michigan Avenue station park & ride facility in West Pullman would require substantial removal of buildings to accommodate the new five-story parking structure. Despite mitigation measures, there would be adverse visual impacts in this area because the scale, density, and character of the local community would be changed.

- Noise
    - The noise from CTA trains combined with existing UPRR freight trains would cause adverse impacts at noise-sensitive buildings in Roseland, Washington Heights, and West Pullman.

Mitigation - Mitigation measures to minimize adverse permanent impacts related to community character and cohesion for the West Option would be similar to those described for the East Option. Visual impacts north of I-57 in Roseland, between 99th and 103rd Street in Washington Heights, near the 103rd Street station in Roseland and Washington Heights, and near the Michigan Avenue station park & ride in West Pullman would remain adverse despite mitigation. Unlike the East Option, the West Option would have no visual impacts from the track structure near the intersection of 117th Street and Prairie Avenue in West Pullman.

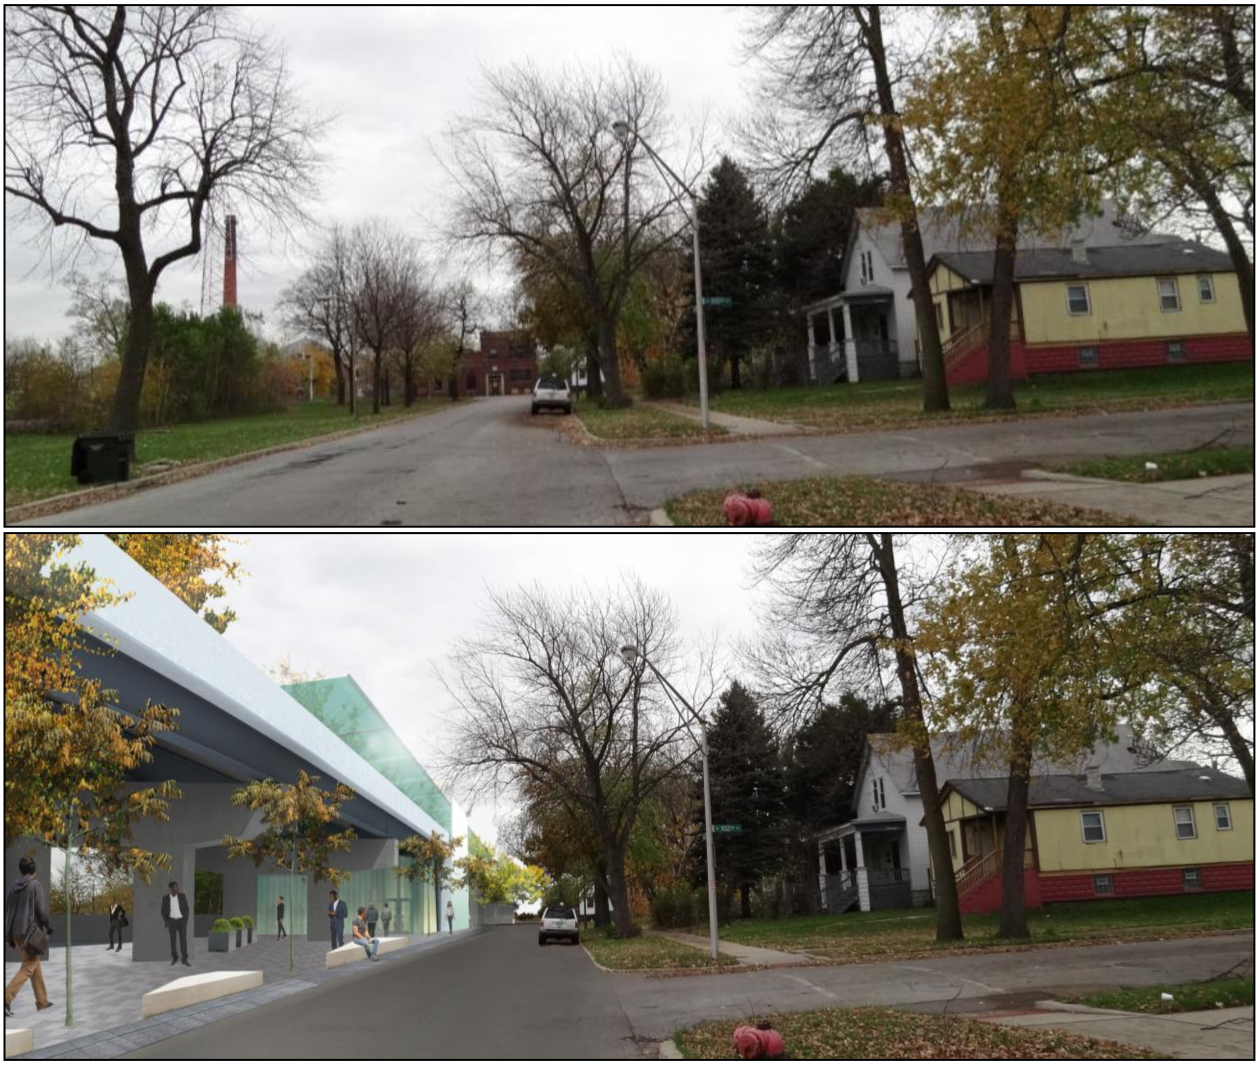

Figure 4-9: Photo of Existing Conditions and Photo Simulation of the Union Pacific Railroad Alternative West Option along Eggleston Avenue and Fernwood Parkway Facing 103rd Street

Mobility

The West Option would substantially reduce travel times between the Washington Heights, Roseland, West Pullman, and Riverdale communities, and would enhance their connection with major employment and activity centers north of the project area. The West Option would result in substantial mobility benefits for Far South Side residents.

Community Resources

The West Option would displace Fernwood Parkway in Washington Heights and the Grace Temple Church of God Established in Christ (11601 S. Michigan Avenue) in West Pullman (see **Figure 4-8**).

The West Option alignment would run through two of the four parcels that make up Fernwood Parkway; the West Option alignment would affect the parcels between 101st and 103rd Streets. Of the 5.3 acres of these two affected parcels of the parkway, approximately 1.9 acres would be overlapped by the elevated structure and its associated clearances. Much of the parkway between 101st and 103rd Streets would be permanently overlapped and shaded by the structure. Elevated track structure supports would be placed permanently in the park space.

The new rail extension would facilitate access to community resources near the station locations, especially for transit-dependent residents, which would be beneficial overall. The RLE would provide direct transit access for residents of and visitors to Altgeld Gardens.

The following permanent adverse impacts on community resources would occur:

- Near Wendell Smith Park, the elevated structure would be taller as part of the West Option than it would as part of the East Option because the CTA tracks would need to cross above the UPRR right-of-way, allowing clearance for freight trains; however, the alignment would not directly affect the park.

- Between 99th and 103rd Streets, the elevated track structure would run along Fernwood Parkway in Washington Heights. Impacts are described under the "Community Character and Cohesion" heading above.

- The Grace Temple Church of God Established in Christ would be displaced; however, as of July 2015 the building is vacant.

Mitigation - Mitigation measures to offset adverse temporary construction-related impacts on community resources would include the following:

- CTA would plant new trees to shield views of the structure from homes fronting the park.

- CTA would keep the area beneath the track structure in Fernwood Parkway open for use, and improve park space elsewhere in the neighborhood.

- In accordance with the Uniform Act (42 USC § 4601, et seq.), CTA would provide relocation assistance for the Grace Temple Church of God Established in Christ to another building or parcel in the surrounding area.

Impacts on parks and proposed mitigation measures, as well as further details on coordination with the Chicago Park District to confirm park-related mitigation measures, are described in **Chapter 8** of this Draft EIS.

Construction Impacts

The West Option would have construction impacts similar to those of the East Option, as described in **Section 4.3.3.2**, except that Block Park would not be affected under the West Option. Construction activities would be needed in Wendell Smith Park in Roseland as well as Fernwood Parkway in Washington Heights. The same mitigation measures identified for the East Option in **Section 4.3.3.2** above would apply.

Impacts Remaining After Mitigation

Despite mitigation, the West Option would have a permanent adverse impact on community character and cohesion due to the visual encroachment of the elevated structure north of I-57 in Roseland, between 99th and 103rd Streets in Washington Heights, at the 103rd Street station area in Roseland and Washington Heights, and at the Michigan Avenue station park & ride facility in West Pullman. Other permanent impacts related to neighborhoods and communities would not be adverse after implementation of mitigation measures.

Construction-related impacts on neighborhoods and communities would not be adverse after implementation of the mitigation measures.

4.4 Visual and Aesthetic Conditions

This section summarizes the existing visual and aesthetic conditions in the project area and describes the visual and aesthetic impacts of the East and West Options. See also the *Visual and Aesthetic Conditions Technical Memorandum* (**Appendix N**). **Table 4-6** summarizes the visual and aesthetic impact findings.

Table 4-6: Visual and Aesthetic Conditions - Impacts Summary

Alternative	Permanent Impacts	Construction Impacts
No Build	No impacts	No impacts
Union Pacific Railroad - East Option	Adverse impacts despite mitigation north of I-57 and at 117th Street and Prairie Avenue	No adverse impacts
Union Pacific Railroad - West Option	Adverse impacts despite mitigation north of I-57, between 99th Street and 103rd Street, near the 103rd Street station, and at the Michigan Avenue station park & ride facility	No adverse impacts

4.4.1 Regulatory Framework/Methods

CTA performed the visual and aesthetic conditions analysis to be consistent with State of Illinois Public Act 093-0545, which requires projects to take the visual context of the project area into consideration. The context includes existing and proposed land uses and zoning and the potential for degradation of the existing visual character or quality of the surrounding community areas. The analysis also considered the potential for the project to create new shade or shadow effects.

CTA considered the guidelines and ordinances that govern visual integrity and quality in the City of Chicago including the Zoning Ordinance, Land Use Ordinance, and the Landmarks Ordinance.

For this analysis, CTA assessed visual and aesthetic impacts by first analyzing existing visual resources in the project area, including any sensitive views, and assessing existing visual quality of the surrounding environment. Sensitive views were determined from research and field observations as well as public comments received as part of CTA's outreach efforts (see **Chapter 10**) CTA then considered changes to the visual environment that would result from the East and West Options. The analysis included an assessment of any changes to the viewsheds or other sensitive views that would affect the essential character or context of the visual environment and any other visual quality impacts. Where any adverse visual impacts were determined to be likely in the context of the visual environment, mitigation methods were proposed.

For this Draft EIS, an impact would be adverse if it resulted in one of the following:

- A change that is inconsistent with the community's aesthetic character
- Incompatibility of a project element with the character of the area
- Incompatibility of a project element with community aesthetic goals
- A substantial degradation of the existing visual character or quality of a site and its surroundings
- Effects on a historic site through extensive remodeling or removal of buildings or their surrounding area (discussed further in **Section 4.7**)
- Creation of new shade and shadow effects

CTA categorized visual and aesthetic changes to the environment as low, moderate, or high based on the following characteristics:

- Low visual changes generally occur when the transit facility is already part of the view and there would be minor or few changes to the transit facility that would create noticeable changes in the view. Low visual changes can be beneficial; low visual changes are not considered adverse.
- Moderate visual changes occur when the existing view would be noticeably different but not substantially different. Removal of vegetation or a single property displacement would be examples of a moderate visual change. Depending on the individual case, moderate visual changes may or may not be adverse, and may be beneficial.
- High visual changes would occur when there is a substantial change to the existing view or when visually sensitive resources would have a change in view. In some cases high visual changes may improve an area. Like other visual changes, high visual changes can be beneficial or adverse.

In addition to categorizing the visual change of a view, CTA also considered the response to a view depending on the type of viewer group that would interact with the view. A viewer group's sensitivity to a change in a view could affect the level of impact on a viewshed. Major viewer groups along the project corridor include residents, passengers, business owners, recreational groups, and visitors.

- Residents are people who are very familiar with their surroundings and interact with the visual environment on a daily basis. Residents would have high viewer sensitivity because of daily interaction with the visual environment.

- Passengers interact with the visual environment on a daily basis because they travel to and from the transit facility. Passengers have less viewer sensitivity than other viewer groups because they only pass through the visual environment and do not live in it.

- Business owners are people who are very familiar with their surroundings and have a vested interest in the visual environment. Business owners would have a higher sensitivity than other groups, such as visitors or passenger groups, based on their familiarity and vested interest in the environment.

- Recreational groups are people who may walk, run, or cycle near the transit facility. Recreational groups have different expectations of the visual environment and have a higher sensitivity to scenic views or neighborhood character than other viewer groups.

- Visitors are individuals who have limited interaction with the area and are not familiar with the visual environment. Visitors have some sensitivity to the surrounding environment.

The *Visual and Aesthetic Conditions Technical Memorandum* (**Appendix N**) includes specific information on the visual assessment process. **Section 4.7** includes a discussion of potential visual effects on historic resources.

4.4.2 Existing Conditions

The visual environment that would be affected by the RLE Project includes areas that would have a view of the new facilities and areas visible from the new facilities. The overall project area has residential (primarily single-family), commercial (urban mixed-use), industrial, transportation, utility, and vacant land uses.

The UPRR Alternative alignment would run south along I-94 from the 95th Street Terminal, then curve west along the north side of I-57. This portion of the corridor has a relatively cohesive landscape and the East and West Options would be on the same alignment in this area. **Figure 4-10** and **Figure 4-11** show the existing conditions along the highway corridors.

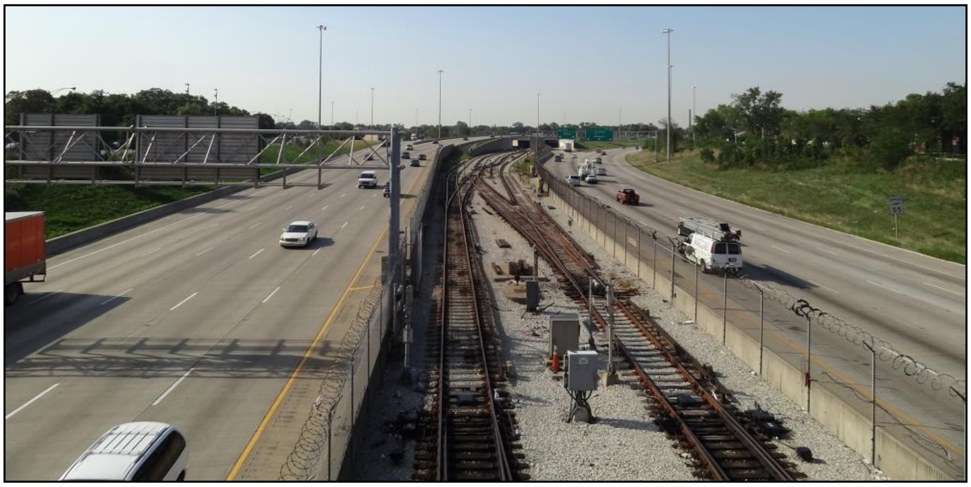

Figure 4-10: Photo Facing South from 95th Street Terminal

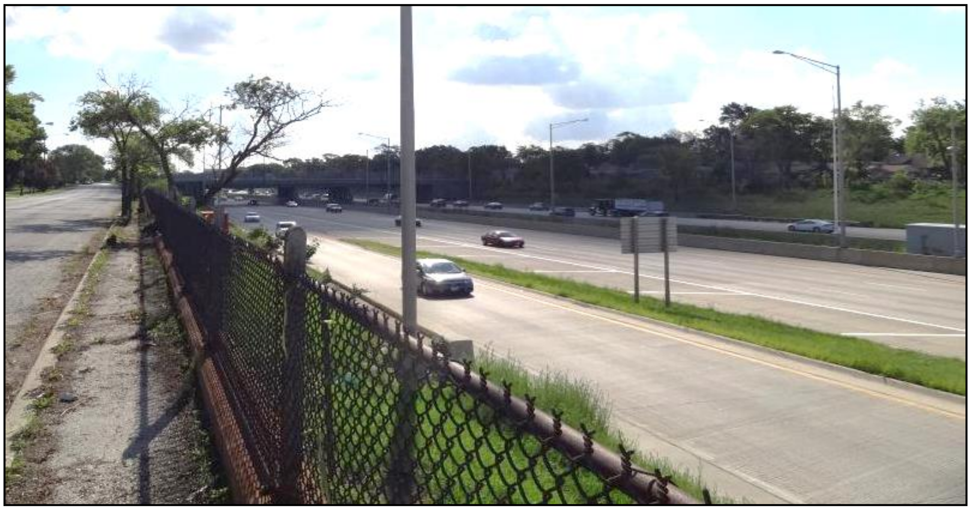

Figure 4-11: Photo Facing East, North of I-57 near 98th Street and Lowe Avenue

South of I-57, the UPRR Alternative corridor would run along an existing railroad corridor that is surrounded by a mix of residential and light commercial districts. The residential development consists of one- to two-story structures of similar style. Light commercial buildings are typically at intersections that meet the existing UPRR tracks at grade. A substantial portion of the development along the corridor is vacant and contains minimum architectural embellishments. The Roseland Pumping Station at 104th Street and Harvard Avenue is one of the few non-residential structures in the area with architectural character. South of 119th Street, the UPRR Alternative alignment would run along the MWRD property and end just north of Altgeld Gardens. Aside from the residences at Altgeld Gardens, this area has a light industrial character. The partially vacant neighborhood is relatively isolated between 130th Street, I-94, and Little Calumet River. **Figure 4-12** and **Figure 4-13** show typical conditions within the UPRR Alternative corridor.

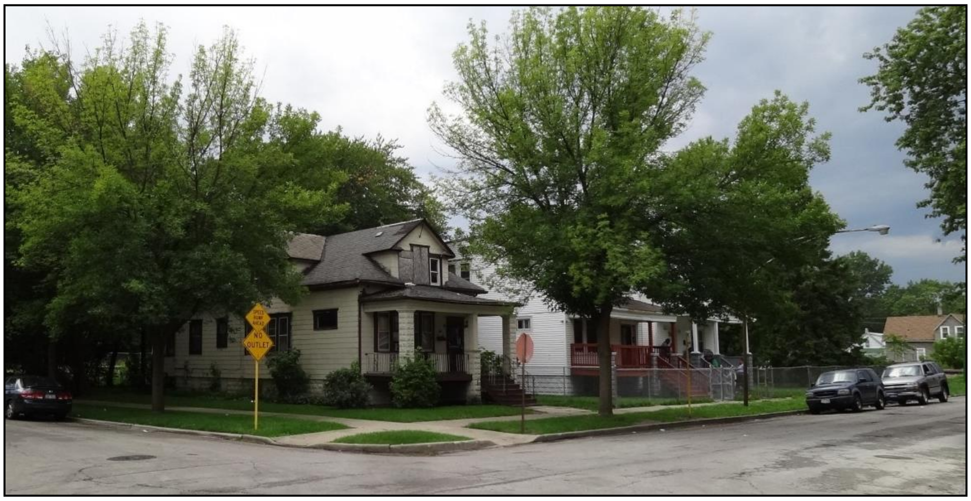

Figure 4-12: Photo Facing Southwest from 113th Street and Princeton Avenue

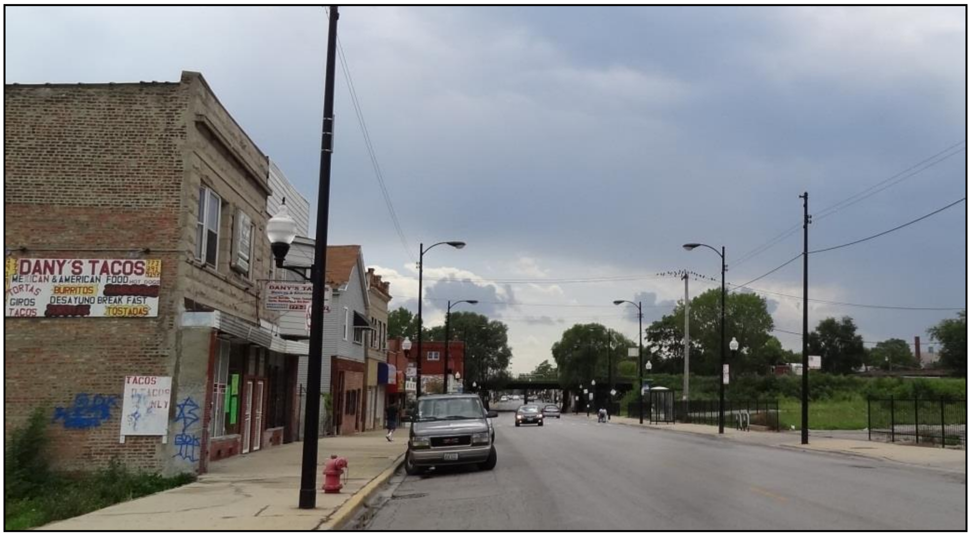

Figure 4-13: Photo Facing South along Michigan Avenue from 115th Street

4.4.3 Environmental Consequences

The following sections summarize the potential visual and aesthetic impacts of each alternative.

4.4.3.1 No Build Alternative

There would be no visual or aesthetic impacts associated with the No Build Alternative; no mitigation measures would be required.

4.4.3.2 Union Pacific Railroad Alternative - East Option

Permanent Impacts

West of Prairie Avenue, the East Option alignment would be in existing highway right-of-way and adjacent to the freight railroad right-of-way. Property acquisition would occur as part of the East Option, and would typically be concentrated near station locations.

Shadows created by the elevated structure would change throughout the day and season. The shadows would vary depending on the height, orientation, and density of surrounding structures, vegetation, and development. A substantial portion of vegetation would be removed on the east side of the project corridor, which would introduce new shadows and light patterns on developments to the east. The majority of vegetation west of the UPRR tracks would remain and would help minimize visible light and shadow effects on residences to the west. Additional lighting would be introduced to the project area, associated with park & ride facilities, stations, substations, yard and shop facilities, and trains (which include interior/safety lighting and exterior headlights). For the East Option, light and glare associated with the alignment and trains would not have an adverse impact, because the proposed features would generally be located in the existing highway corridor or near the existing UPRR corridor—areas that currently produce transportation-related light and glare.

High and adverse visual impacts would occur north of I-57 because of the change in the visual setting due to the elevated track structure in the highway right-of-way. The elevated track structure would block the horizon for the homes or pedestrians closest to 98th Place and would also create a new shadow at street level due to the movement of the sun. The elevated track structure would change the scale, density, and character of the residential neighborhood north of I-57. **Figure 4-14** shows existing conditions and a photo simulation of the track structure in the I-57 right-of-way.

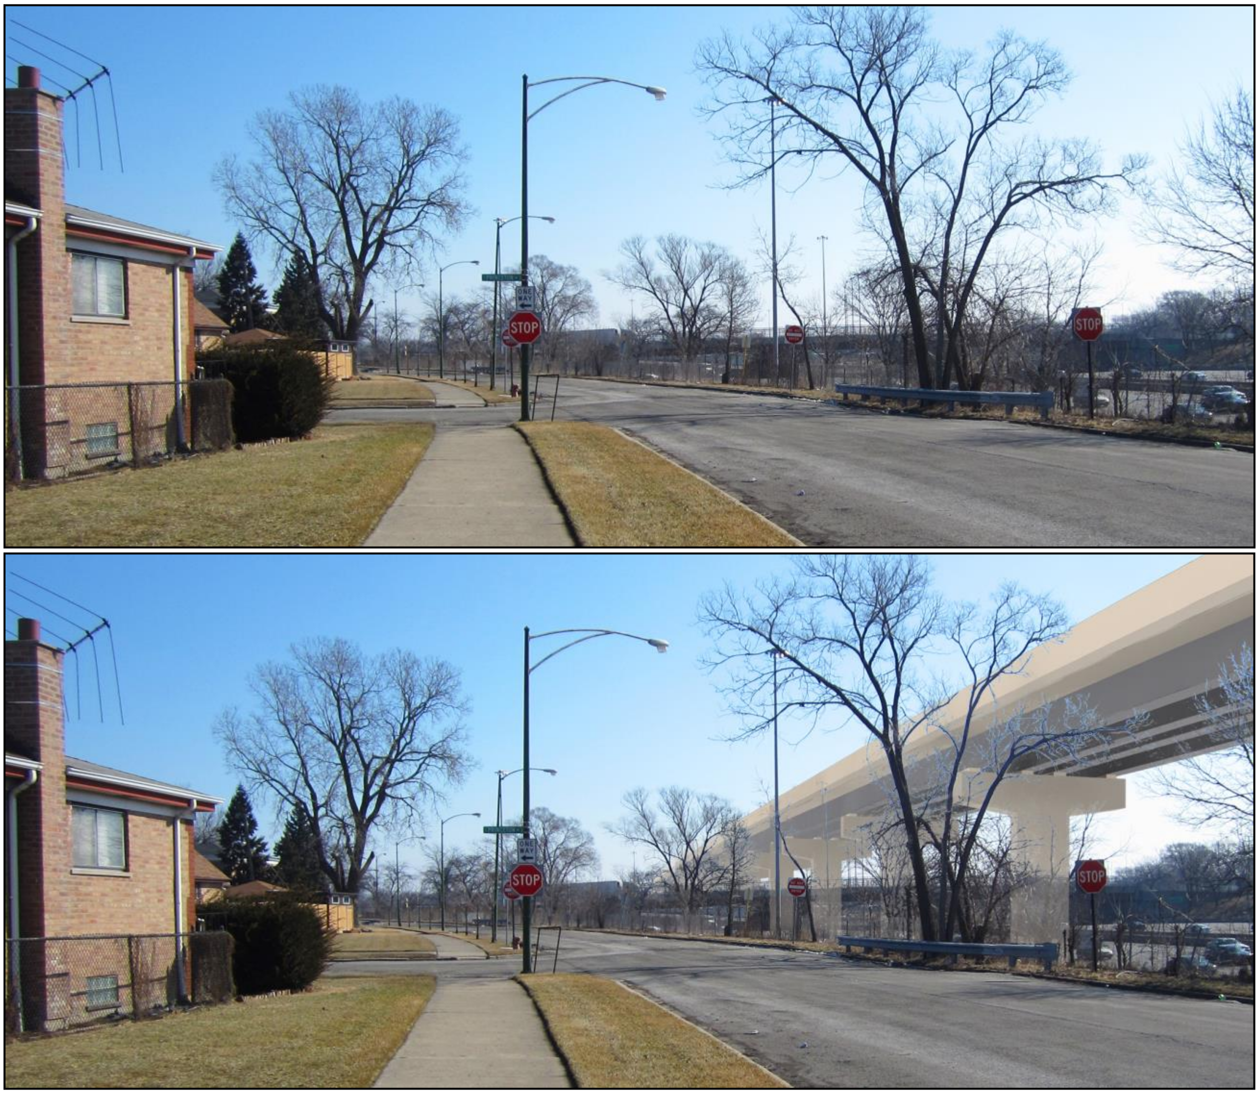

Figure 4-14: Photo of Existing Conditions and Photo Simulation of the Elevated Track Structure in the I-57 Right-of-Way, Facing East from 98th Place and Princeton Avenue

High and adverse visual impacts would occur at 117th Street and Prairie Avenue because of the elevated track structure. **Figure 4-15** shows existing conditions and a photo simulation of the East Option viaduct facing southeast from 117th Street, east of Prairie Avenue. The residential character and scale would be substantially altered by the removal of vegetation and neighborhood fabric and the addition of elevated structure east of the embankment.

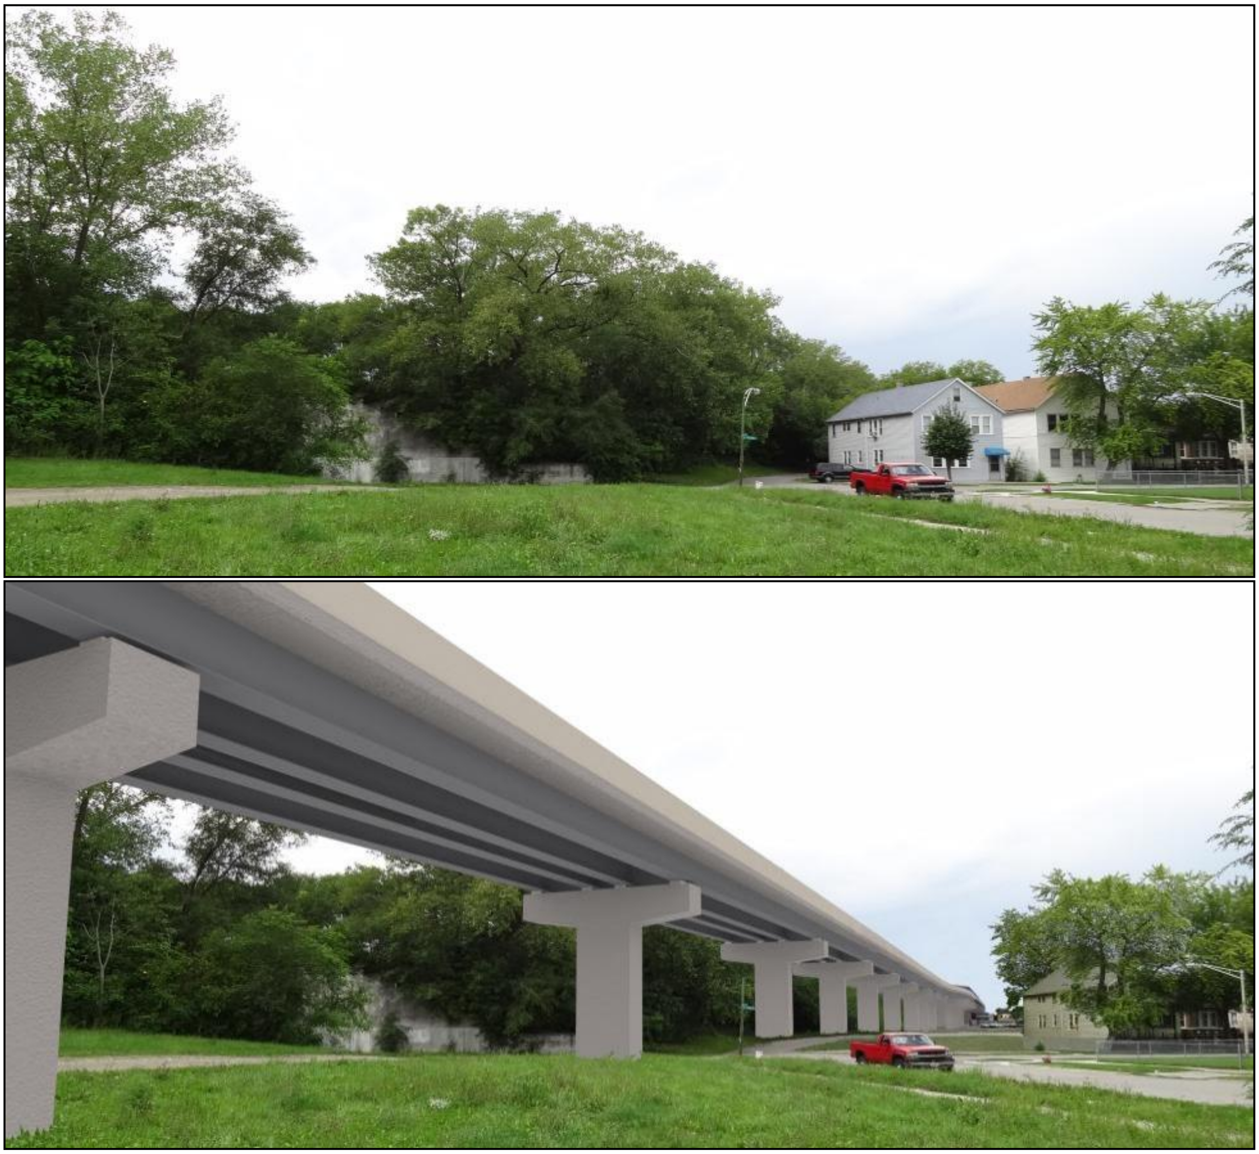

Figure 4-15: Photo of Existing Conditions and Photo Simulation of the Union Pacific Railroad Alternative East Option Viaduct Facing Southeast from 117th Street, East of Prairie Avenue

Mitigation - Mitigation measures would reduce the impacts north of I-57 and at 117th Street and Prairie Avenue, but due to the proximity of the elevated structure to residential areas, the impacts would remain high and adverse despite mitigation. Mitigation measures would include landscaping, using urban design techniques to reduce massing, and creating pedestrian-friendly surroundings. Techniques that may be used include planting larger trees near structures to break the sight lines, with smaller scale landscaping near the streets to mimic landscaping on the opposite side of the streets.

Construction

Construction-related visual impacts would be similar for both the East and West Options. The duration of construction for either option would vary from several months to a few years depending on the alignment location and which facilities are there. Construction-related visual impacts would not be adverse and would include construction fencing, demolition of existing buildings, temporary walls, temporary street closures and related signage, temporary lighting or entrances, and/or shoring of concrete structures or existing viaducts.

Mitigation - Although construction-related visual impacts related to the East Option would not be adverse, CTA would maintain as much existing vegetation as practical and minimize temporary construction impacts on neighborhoods by limiting the light trespassing from night lighting. BMPs and debris-free construction areas would mitigate temporary visual impacts from the construction sites.

Impacts Remaining After Mitigation

The East Option would have permanent high and adverse visual and aesthetic impacts north of I-57 and at 117th and Prairie Street despite implementation of mitigation measures.

4.4.3.3 Union Pacific Railroad Alternative - West Option

Permanent Impacts

General light and shadow conditions for the West Option would be similar to those discussed for the East Option. High and adverse visual impacts would occur north of I-57 because of the change in the visual setting due to the elevated track structure in the highway right-of-way. The track structure would change the scale, density, and character of the residential neighborhood north of I-57.

In addition to shadows and light patterns created by the elevated structure, the removal of vegetation along the west side of the existing railroad corridor between 99th Street and 103rd Street (along Fernwood Parkway) would alter the visual quality for developments to the west. Visual impacts between 99th Street and 103rd Street, including the 103rd Street station, would be high and adverse. Several buildings and some vegetation along the west side of the existing UPRR corridor would be removed to accommodate the new station and surface parking lot. The elevated platforms and track structure would have a high impact on the viewshed of residences adjacent to the project alignment and would create new shadows. **Figure 4-9** shows a photo simulation of the West Option along Fernwood Parkway near the 103rd Street station.

Near the Michigan Avenue station, the West Option would have high and adverse impacts similar to those of the East Option. The addition of the five-story park & ride facility and the removal of buildings and vegetation would have an adverse impact on the character and building density of the local community. **Figure 4-16** shows existing conditions and a photo simulation of how the West Option Michigan Avenue station area could look.

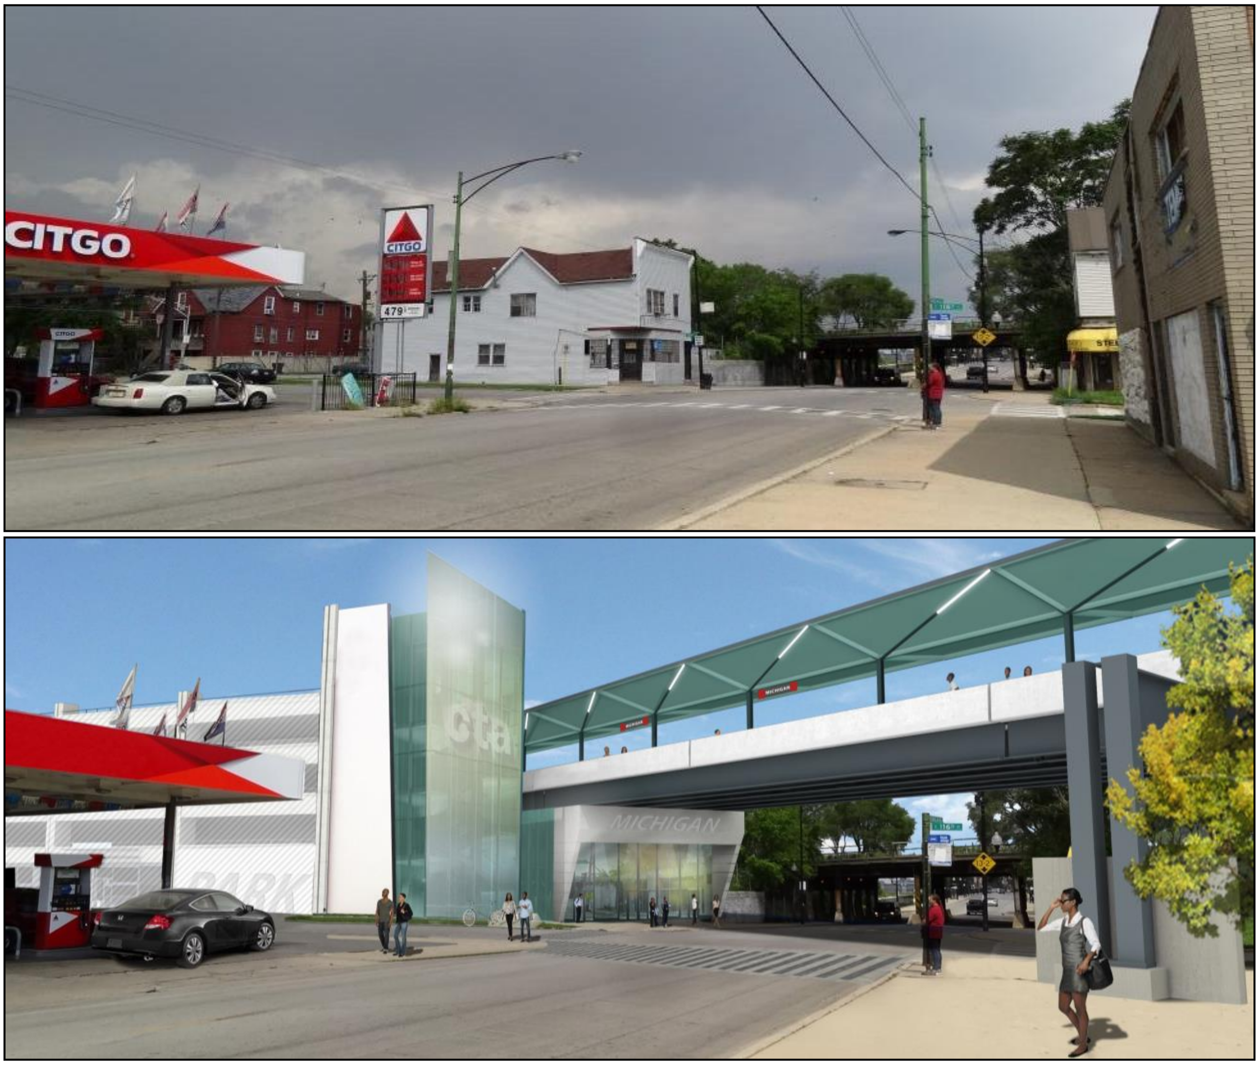

Figure 4-16: Photo of Existing Conditions and Photo Simulation of the Union Pacific Railroad Alternative West Option Michigan Avenue Station and Parking Structure Facing Northwest along Michigan Avenue

Mitigation - Mitigation measures would reduce the impacts in the area north of I-57 and from approximately 99th Street to 103rd Street, including 103rd Street station. Mitigation measures would include providing landscaping and replanting vegetation where possible. In addition, the 103rd Street station would be designed to be consistent with the character and scale of the surrounding neighborhood. Due to the scale of the elevated structure, proposed station and its proximity to adjacent residences, impacts after mitigation would remain high and adverse.

Mitigation measures would reduce the impacts near the Michigan Avenue station park & ride facility, but due to the structure's proximity to residential areas, the impacts would remain adverse despite mitigation. Mitigation measures would include landscaping, designing the park & ride facility to match the character of the surrounding neighborhood, using urban design techniques to reduce massing, and creating pedestrian-friendly surroundings. The use of larger setbacks to accommodate wider sidewalks or pedestrian areas, architectural styles, building treatments, and facades are examples of how the design of the structure would be incorporated into the neighborhood to minimize the visual impacts. Exterior lighting would be shielded and carefully placed when adjacent to sensitive areas such as residential communities.

Construction Impacts

The duration of construction and types of visual impacts for the West Option would be similar to those of the East Option. Construction-related impacts would not be adverse. The types of visual impacts and the proposed impact-minimizing mitigation measures for the West Option would be similar to those described for the East Option.

Impacts Remaining After Mitigation

The West Option would have high and adverse permanent visual and aesthetic impacts north of I-57, from 99th Street to 103rd Street, including the 103rd Street station, and near the Michigan Avenue station park & ride facility despite implementation of mitigation measures.

4.5 Noise and Vibration

This section summarizes the predicted noise and vibration impacts of the East and West Options.

Noise is "unwanted sound," generally measured in terms of loudness. The loudness, or magnitude, of noise determines its intensity and is measured in decibels (dB). The overall noise level from environmental sources is described in A-weighted decibels (dBA). The A-weighted decibel scale was developed to better approximate the sensitivity of human hearing. Because the decibel is based on a logarithmic scale, a 10-dB increase in noise level is generally perceived as a doubling of loudness, while a 3-dB increase in noise is just barely perceptible to the human ear (FHWA 2011).

Ground-borne vibration can be caused by the vibration of a transit structure, creating vibration waves that propagate through the soil and rock to the foundations of nearby buildings. The vibration of floors and walls may cause perceptible vibration, rattling of items such as windows or dishes on shelves, a rumble noise, or damage to buildings in extreme cases. Vibration is described in terms of velocity (L_v) and is measured in decibels (VdB), which is the root mean square vibration velocity relative to 1 microinch per second (FTA 2006).

The *Noise and Vibration Technical Memorandum* (**Appendix O**) contains additional information. **Table 4-7** summarizes the noise and vibration impact findings.

Table 4-7: Noise and Vibration - Impacts Summary

Alternative	Permanent Impacts		Construction Impacts	
	Noise	Vibration	Noise	Vibration
No Build	No impacts	No impacts	No impacts	No impacts
Union Pacific Railroad - East Option	574 moderate and 83 severe impacts on noise-sensitive receivers No impacts after mitigation	No impacts	No impacts	No impacts
Union Pacific Railroad - West Option	738 moderate and 49 severe impacts on noise-sensitive receivers No impacts after mitigation	No impacts	No impacts	No impacts

4.5.1 Regulatory Framework/Methods

CTA analyzed noise and vibration impacts from this project in accordance with the FTA (2006) *Transit Noise and Vibration Impact Assessment* guidance manual. The FTA guidance manual sets forth the basic concepts, methods, and procedures for evaluating the extent and severity of the noise and vibration impacts from transit projects.

The guidance manual describes three levels of analysis that may be applied depending on the complexity of the project. The first level is a screening procedure to determine whether noise-sensitive receivers would be present based on the land uses in the vicinity of the project. The outcomes of the screening procedure determine whether more detailed noise and vibration analysis is required. There are known sensitive receivers for the RLE Project, so further analysis was required. There are two levels of quantitative analysis for predicting impacts: a general assessment and a detailed analysis. The general assessment identifies and estimates the severity of noise and vibration impacts that could occur with implementation of the project. The general assessment provides information needed to differentiate between the East and West Options. The detailed analysis quantifies impacts through an in-depth analysis of a single design configuration.

CTA completed a general assessment for the UPRR corridor to provide basic information for comparing the severity of impacts from implementation of the East and West Options. The impacts disclosed in this Draft EIS are maximum, worst-case impacts. More detailed analysis in the Final EIS may identify areas where impacts may be further reduced through design.

The thresholds of significance for this project are based on FTA's operational and construction noise and vibration criteria, as described in the guidance manual. CTA conducted an assessment to identify the areas that could be subject to a moderate or severe impact along the proposed alternative alignments. This assessment established an impact contour as the basis for analysis, rather than individual analysis of each noise-sensitive receiver, because of the high density of residential areas abutting the East and West Option alignments. The impact contour defines the outer limit where a moderate or severe impact would occur based on the distance from the noise-generating source (East and West Options). CTA used the contours to estimate the potential for noise and vibration impacts along each of the option alignments.

CTA further refined the general assessment to identify individual noise-sensitive receivers within the moderate and severe impact contours. As part of a field verification of noise-sensitive receiver locations, CTA counted noise-sensitive receivers within the moderate and severe impact contours unless identified as potentially displaced properties. The identified affected noise-sensitive receivers were counted individually but were mapped as noise-sensitive receiver clusters because of the small size of the individual parcels. The clusters of receivers were determined to be similar distances from the proposed tracks and in areas where the CTA operating conditions, such as train speed, were determined to be similar.

Operational Noise

Operational noise is the noise that would occur with the ongoing operation of an implemented alternative. To determine whether the noise levels from a project might affect an area, CTA compared the existing noise levels near where the Red Line trains would run to the projected future noise levels generated by the project. FTA uses three different land use categories for identifying noise-sensitive receivers (see **Table 4-8**). FTA does not consider most commercial and industrial receivers to be sensitive to transit-related noise.

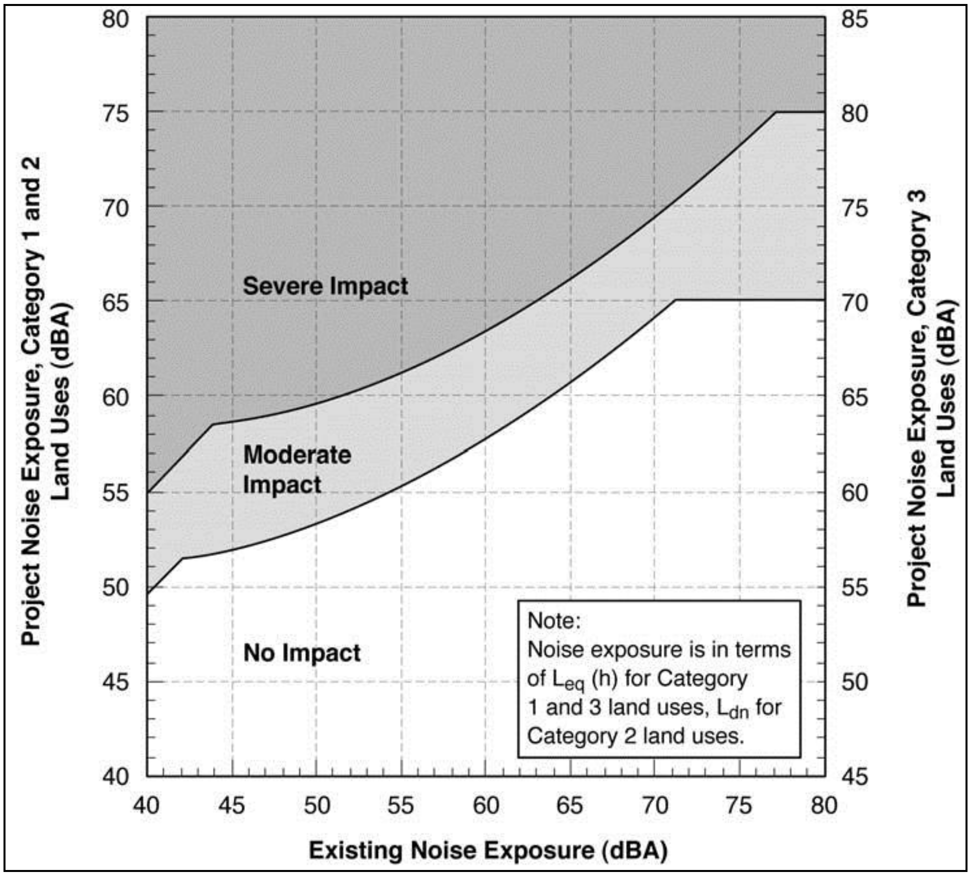
Table 4-8: FTA Land Use Categories and Noise Metrics

Land Use Category[1]	Noise Level[2]	Description
1	L_{eq}(h)	Tracts of land set aside for serenity and quiet, such as outdoor amphitheaters, concert pavilions, and historic landmarks.
2	L_{dn}	Buildings used for sleeping, including residences, hospitals, hotels, and other areas where nighttime sensitivity to noise is of utmost importance.
3	L_{eq}(h)	Institutional land uses with primarily daytime and evening uses including schools, libraries, churches, museums, cemeteries, historical sites and parks, and certain recreational facilities used for study or meditation.

FTA = Federal Transit Administration
Source: FTA 2006
[1] Land Use Categories are based on sensitivity to noise intrusions.
[2] The threshold noise limits include an hourly equivalent noise level (or L_{eq}(h)) for Category 1 and 3 noise-sensitive receivers and the day-night noise level (or L_{dn}) for Category 2 noise-sensitive receivers. The FTA noise limits, which are based on the existing background levels, are determined using empirical formulas shown graphically in **Figure 4-17**.

FTA has two categories for its noise impact criteria: moderate impact and severe impact. The moderate impact threshold defines areas where the change in noise would be noticeable but might not be sufficient to cause a strong, adverse community reaction. The severe impact threshold defines the noise limits above which a significant percentage of the population would be highly annoyed by the change in noise.

As shown in **Figure 4-17**, the FTA noise impact criteria are defined by two curves that allow increasing project noise levels as existing noise increases up to a point, beyond which an impact would be determined based on project noise alone. Category 1 noise-sensitive receivers (such as an amphitheater or historic landmark) are represented along the left axis and are described by the hourly equivalent noise level (hourly L_{eq}).[4] Category 2 noise-sensitive receivers (such as residences, hotels, and hospitals) are also represented along the left axis, but are described by the 24-hour day-night level (L_{dn}).[5] Category 3 noise-sensitive receivers (such as schools and churches) are represented along the right axis and are described by the hourly L_{eq} noise metric.



Source: FTA 2006

L_{eq}(h) = hourly equivalent noise level, L_{dn} = day-night noise level

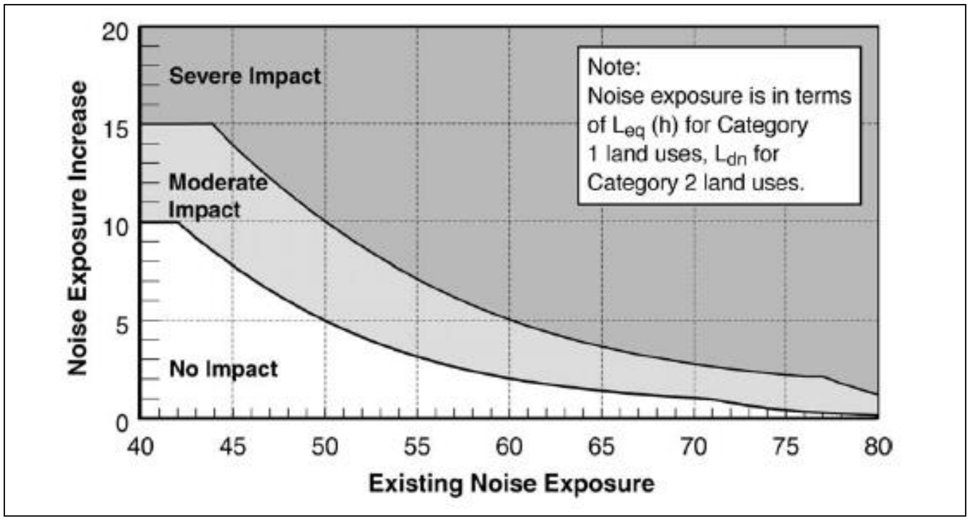
Figure 4-17: Noise Impact Criteria for Transit Projects

Although the curves in **Figure 4-17** are defined in terms of the project noise exposure and the existing noise exposure, it is the project's increase in noise compared to existing noise levels that is the basis for the criteria. To illustrate this point, **Figure 4-18** shows the noise impact criteria for Category 1 and 2 land uses in terms of the allowable increase in the existing noise exposure. The horizontal axis is the existing noise exposure and the vertical axis is the increase in noise level due to the project. The curves in **Figure 4-18** show that the criterion for impact allows a noise exposure increase of 10 dBA if the existing noise exposure is 42 dBA or less, but only a 1-dBA increase when the existing noise level is 70 dBA. As the existing level of noise increases, the total amount that the community noise exposure is allowed to increase is reduced.

---

[4] L_{eq}, the hourly equivalent noise level, describes a receiver's cumulative noise exposure from all events over a 1-hour period.

[5] L_{dn}, the day-night sound level, is a measure of community noise over a 24-hour period. In the calculation of L_{dn}, noise that occurs during the nighttime hours (10:00 PM to 7:00 AM) is given a weighting that causes one train during the nighttime hours to be equivalent to 10 trains during the daytime hours.



Source: FTA 2006
L_{eq}(h) = hourly equivalent noise level, L_{dn} = day-night noise level
Figure 4-18: Allowable Increase in Noise Levels

Operational Vibration

CTA used FTA criteria to assess annoyance due to vibration and ground-borne noise from transit operations. **Table 4-9** shows the FTA vibration criteria for evaluating ground-borne vibration and noise impacts from train pass-bys at nearby vibration-sensitive receivers. These vibration criteria (expressed in VdB) are related to ground-borne vibration levels that are expected to result in human annoyance. FTA's experience with community response to ground-borne vibration indicates that when there are only a few train events per day, it would take higher vibration levels to evoke the same community response that would be expected from more frequent events. This community response to ground-borne vibration is accounted for in the FTA criteria by distinguishing between projects with frequent (more than 70 train events per day), occasional (30 to 70 train events per day), and infrequent events (fewer than 30 train events per day). The vibration levels shown in **Table 4-9** are defined in terms of human annoyance for different land use categories: high sensitivity (Category 1), residential (Category 2), and institutional (Category 3). In general, the threshold of human perceptibility of vibration is 65 VdB.

The vibration levels shown in **Table 4-9** are well below the damage criteria levels of 95 to 100 VdB. It is extremely rare for vibration from transit operations to cause any sort of building damage, even minor cosmetic damage.

Table 4-9: FTA Ground-Borne Vibration and Noise Impact Criteria for Annoyance

Land Use Category Description	Ground-Borne Vibration Levels (VdB)[1]			Ground-Borne Noise Levels (dBA)[2]		
	Frequent Events[3]	Occasional Events[4]	Infrequent Events[5]	Frequent Events[3]	Occasional Event[4]	Infrequent Event[5]
Category 1: Buildings where low vibration is essential for interior operations	65	65	65	NA[6]	NA[6]	NA[6]
Category 2: Residences and buildings where people normally sleep	72	75	80	35	38	43
Category 3: Institutional buildings with primarily daytime use	75	78	83	40	43	48

Source: FTA 2006

[1] Root mean square vibration velocity levels are reported in decibels (or VdB) referenced to 1 microinch per second.

[2] Ground-borne noise levels are reported in A-weighted decibels (dBA) referenced to 20 micropascals.

[3] "Frequent Events" is defined as more than 70 vibration events per day.

[4] "Occasional Events" is defined as between 30 and 70 vibration events per day.

[5] "Infrequent Events" is defined as less than 30 vibration events per day.

[6] NA means "not applicable." Vibration-sensitive equipment is not sensitive to ground-borne noise.

FTA = Federal Transit Administration

While vibration criteria are generally used to assess annoyance from transit sources at the exterior faces of vibration-sensitive receivers, ground-borne noise, or the rumbling sound due to vibrating room surfaces, is typically assessed indoors. In general, the relationship between vibration and ground-borne noise depends on the dominant frequency of the vibration and the acoustical absorption characteristics of the receiving room. Due to the limited data available regarding soil and ground propagation characteristics, average or typical soil conditions (hard compacted soil) were assumed everywhere along the project corridor. According to the FTA guidance, the dominant vibration frequency from train pass-bys along typical ground and soil conditions generally occurs in the 30–60 Hertz range. The ground-borne noise levels were adjusted accordingly.

Construction Noise

During the preliminary environmental permitting phase of a project, when construction details are limited, FTA suggests evaluating proposed construction scenarios against the 1-hour L_{eq} thresholds shown in **Table 4-10**. These criteria are compared to noise levels from the two loudest pieces of equipment that, under worst-case conditions, would operate continuously for 1 hour.

Table 4-10: Recommended FTA Construction Noise Limits

Land Use Category	Construction Period[2]	
	Daytime (dBA)[1]	Nighttime (dBA)[1]
Residential	90	80
Commercial	100	100
Industrial	100	100

Source: FTA 2006

[1] The Federal Transit Administration (FTA) construction noise limits are reported for the peak 1-hour period in A-weighted decibels (or dBA).

[2] Construction noise limits are established for both daytime (7 AM-10 PM) and nighttime (10 PM-7 AM) activities. The maximum noise limits represent noise levels from the two loudest pieces of equipment operating at full power over a period of 1 hour.

Construction Vibration

For evaluating potential annoyance or interference with vibration-sensitive activities due to construction vibration, CTA used the FTA criteria in **Table 4-11**. In most cases, however, the primary concern regarding construction vibration relates to potential damage to buildings. **Table 4-11** contains the FTA guidance vibration damage criteria for various structural categories of buildings. The vibration damage criteria listed for Category IV structures include historic buildings.

Table 4-11: Construction Vibration Damage Criteria

Building Category	Peak Particle Velocity (inches/second)	Approximate VdB[1]
I. Reinforced-concrete, steel or timber (no plaster)	0.5	102
II. Engineered concrete and masonry (no plaster)	0.3	98
III. Non-engineered timber and masonry buildings	0.2	94
IV. Buildings extremely susceptible to vibration damage	0.12	90

Source: FTA 2006

[1] Root mean square velocity in decibels (VdB) relative to 1 microinch/second

Construction vibration is generally assessed in cases where there is a substantial potential for impacts from construction activity. Such activities include blasting, pile-driving, demolition, and drilling or excavation near vibration-sensitive structures.

4.5.2 Existing Conditions

Sensitive Receivers

CTA conducted a field verification of noise-sensitive receiver locations on March 5, 2015. The land use in the vicinity of the corridor is predominantly residential (Category 2). Three parks, six schools, and four churches (Category 3) are near the corridor. During the field verification, numerous uninhabited residences were identified scattered throughout the area. Although they are not occupied and are not likely to be occupied, these properties are included in the counts of noise-sensitive receivers because they are not contiguous and are adjacent to occupied homes. The land use in the area is expected to continue to be residential, and it is possible that these properties may be resold for residential development. As such, these homes have been considered in the counts because it is anticipated that the residential land use of the area will not change. The majority of these houses were between 105th Street and 115th Street on the east side of the corridor and along Eggleston Avenue from 107th Street to 108th Street on the west side of the corridor. Although these areas would be affected and there are noise-sensitive receivers in the area, the overall impacts would likely be few because the properties are not in use. No sensitive receivers were identified south of the CN/ME corridor, which crosses the UPRR tracks near 119th Street.

Noise Measurements

CTA obtained noise measurements during October 19–26, 2012 at four representative noise-sensitive receiver locations along the UPRR Alternative alignment. The noise measurements consisted of 24-hour noise measurements at residential locations to determine the highest hourly L_{eq} and day/night average sound level (L_{dn}) occurring along the alignment. The noise measurement locations represented sensitive receivers that might be affected by noise from the project. Noise measurements along the UPRR tracks ranged from 74 to 77 dBA.

Figure 4-19 shows the measured highest L_{eq} and L_{dn} obtained at each of the four locations. The dominant noise source along the UPRR Alternative alignment is existing freight rail operation.

Figure 4-19: Vibration and Noise Measurement Locations and Measured Noise and Vibration Data

Vibration Measurements

CTA also obtained vibration measurements at two of the noise measurement locations to determine the existing vibration levels along the UPRR Alternative alignment. The vibration measurement locations represented sensitive receivers that might be affected by vibration from the project.

Figure 4-19 shows the measured vibration level obtained at both locations. The vibration levels measured along the UPRR rail corridor were due to freight rail operations. At a distance of approximately 100 feet from the freight train pass-bys, the measured vibration levels ranged from 75 to 80 VdB.

4.5.3 Environmental Consequences

The following sections summarize the potential noise and vibration impacts projected for each alternative.

4.5.3.1 No Build Alternative

The No Build Alternative assumes no change in the existing conditions except for renovation of CTA's 95th Street Terminal (construction is expected to be completed in 2018). All impacts related to the construction and operation of the 95th Street Terminal are documented in the approved *95th Street Terminal Improvement Project Environmental Assessment* (CTA 2013). FTA issued a Finding of No Significant Impact for the 95th Street Terminal Improvement Project in April 2013, and an Amended Finding of No Significant Impact in July 2013. An Environmental Assessment Re-Evaluation performed by FTA in July 2016 confirmed that the Amended Finding of No Significant Impact dated July 2013 remains valid and that noise impacts from the 95th Street Terminal Improvement Project would not be significant. There would be no change to the existing noise and vibration levels within the project area under the No Build Alternative. As a result, the No Build Alternative would result in no impact, and would require no mitigation.

4.5.3.2 Union Pacific Railroad Alternative - East Option

The noise analysis is based on the following UPRR Alternative components as described in **Chapter 2**: a closed-deck, steel and concrete aerial track structure with welded rail. The frequency of the proposed service is anticipated to be the same as with the current Red Line service (April 2016) at 95th Street Terminal, which ranges from 3–6 minutes during peak periods to 13–15 minutes at night, with an average daytime headway of 6.1 minutes. The UPRR train frequency is 27 trains per day. Based on the proposed RLE operations and the existing noise measurements, CTA established impact contours for moderate and severe impacts based on FTA criteria. Although the noise analysis was performed based on the 2012 Red Line operations plan, average daytime headways have not changed between 2012 and April 2016 and are consistent with the daytime average headways used in the noise analysis. **Table 4-12** lists distances from the proposed alignment (distances are the same for both the East and West Options) to the moderate and severe impact contours as well as the associated noise level criterion. CTA applied the contours throughout the entire corridor. **Figure 4-20** and **Figure 4-21** show the moderate and severe noise impact contours and the clusters of affected noise-sensitive receivers associated with the East Option. The impact contours close in near the station areas because there would be less noise from the trains as they decrease speed when approaching the stations.

Table 4-12: Federal Transit Administration Moderate and Severe Impact Distances - Union Pacific Railroad Alternative (at 55 miles per hour)

Location Number	Receiver Description/ (Area of Impact)	Measured Noise Level	FTA Moderate Impact		FTA Severe Impact	
		(L_{dn}) (Highest Hour L_{eq})	Criterion	Distance	Criterion	Distance

Figure 4-21: Union Pacific Railroad Alternative East Option with Moderate (in Blue) and Severe (in Red) Impact Noise Contours (2 of 2)

Permanent Noise Impacts

Residential noise-sensitive receivers fall within the moderate and severe impact contours for the East Option. There are 574 noise-sensitive receivers within the moderate impact contour: 221 on the west side of the corridor and 353 on the east side of the corridor. A total of 83 noise-sensitive receivers lie within the severe impact contours: 25 on the west side of the corridor and 58 on the east side of the corridor. Noise-sensitive receivers identified as displacements were not counted as being affected.

Noise-sensitive receivers are present within the moderate impact contour throughout the majority of the corridor from 99th Street to the CN/ME tracks near 119th Street. On the west side of the corridor the noise-sensitive receivers within the moderate impact contour are concentrated in the area northwest of the I-57/I-94 interchange. Two churches, the Soul Reviving Baptist Church (9537 S. Perry Avenue) and Kingdom Global Outreach Ministries (10132 S. Eggleston Avenue), could be subject to a moderate impact before mitigation. The remaining noise-sensitive receivers within the moderate impact contour are sparsely located between 112th Street and Prairie Avenue.

The majority of the noise-sensitive receivers within the severe impact contour are along both sides of the corridor between 99th Street and 103rd Street, and mostly along the east side between 105th Street and 111th Street. The *Noise and Vibration Technical Memorandum* (**Appendix O**) contains detailed figures showing the noise impact contours. The project could result in a severe impact on Wendell Smith Park and a moderate impact on Block Park and Kensington Park before mitigation. A portion of Wendell Smith Park would be affected by the project and the remaining portion of the park may have a severe impact before mitigation.

The property between State Street and Michigan Avenue south of 115th Street is vacant and there are no noise-sensitive receivers in this area of the corridor. The structures south of the UPRR tracks between State Street and Michigan Avenue are identified as displacements and therefore are not counted as receptors. No impacts are anticipated in the area south of the CN/ME corridor (which runs near 119th Street), because there are no sensitive receivers there. Altgeld Gardens, which is southwest of the 130th Street station location, would not be affected because it falls outside the impact area. **Table 4-13** details the number of affected noise-sensitive receivers between station areas.

Table 4-13: Sensitive Receivers within Moderate and Severe Noise Impact Contours - Union Pacific Railroad Alternative East Option

Area of Impact	West of Track Structure	East of Track Structure	Total
95th Street to 103rd Street	167 Moderate 25 Severe	108 Moderate 22 Severe	275 Moderate 47 Severe
103rd Street to 111th Street	1 Moderate 0 Severe	107 Moderate 25 Severe	108 Moderate 25 Severe
111th Street to Michigan Avenue at 116th Street	37 Moderate 0 Severe	98 Moderate 4 Severe	135 Moderate 4 Severe
Michigan Avenue to CN/ME Tracks near 119th Street	16 Moderate 0 Severe	40 Moderate 7 Severe	56 Moderate 7 Severe
Total	**221 Moderate 25 Severe**	**353 Moderate 58 Severe**	**574 Moderate 83 Severe**

Noise-affected receivers along the project corridor would require mitigation. The project could result in a moderate noise impact on three churches, three parks, and residential areas along both sides of the rail corridor. The East Option could result in a severe noise impact on one park and small, scattered residential areas along the east side of the corridor between 101st Place and 103rd Street, between 108th Street and 111th Street, just north of 11th Street and 114th Street, and just south of 116th Street. Although the schoolyard at Kwame Nkrumah Academy is within the moderate impact contour, the school building is outside the moderate impact contour; the school building would not have severe or moderate noise impacts. No other schools are within the severe or moderate noise contours.

Mitigation - To reduce noise impacts below FTA noise impact criteria, CTA would construct a noise barrier approximately 4 feet in height (measured from the top surface of the concrete deck) to reduce noise transmission at and below the height of the tracks. The 4-foot-high noise barrier would provide a 10-dBA reduction in noise along both sides of the elevated track structure from the 95th Street Terminal to the CN/ME tracks near 119th Street. All moderate or severe noise impacts would be resolved with mitigation. No moderate or severe impacts would remain after mitigation, including at Wendell Smith Park.

Permanent Vibration Impacts

The elevated track structure with continuously welded rail would result in vibration levels that would be below the FTA impact criterion of 72 VdB at the residential noise-sensitive receivers along the project corridor. The project would therefore result in no impacts from vibration and no mitigation measures would be required.

Construction Impacts

The East Option would include the construction of an elevated track structure, stations, and parking facilities at the stations. Construction noise levels are not expected to exceed the FTA-recommended construction noise limits shown in **Table 4-10**.

The construction contractor would employ noise-reducing construction BMPs. The contractor would keep all construction equipment exhaust mufflers in a state of good repair. As part of the construction specifications, the contractor would be responsible for adhering to the noise control requirements of the project. To the maximum extent possible, vehicles not in use would not remain idling on the construction site. CTA would limit nighttime construction near residences to the extent practicable. There would be no residential noise-sensitive receivers within 150 feet of the construction activity along the I-57 right-of-way. CTA would inform community members about construction schedules, and would coordinate in advance with aldermen and local officials.

High-vibration activities during construction include demolition of buildings, construction of aerial structures, pavement breaking, and ground compaction. Vibration limits are the levels at which there is a risk for damage, not the level at which damage would occur. The impact threshold distances were calculated and it was determined from the analysis that most of the equipment can be operated without risk of damage at distances of 15 feet or greater from non-engineered timber and masonry buildings or at distances of 8 feet or greater from reinforced concrete buildings. Pile-driving would be avoided in the vicinity of the historic Roseland Pumping Station.

Impacts Remaining After Mitigation

With a 10-dBA reduction provided by an approximately 4-foot-high noise barrier, all severe and moderate noise impacts would be resolved with mitigation. Beyond the use of noise-reducing construction BMPs, construction noise mitigation measures would not be required. There would be no vibration impacts; no mitigation measures for vibration are proposed.

4.5.3.3 Union Pacific Railroad Alternative - West Option

The noise analysis is based on the following UPRR Alternative components as described in **Chapter 2**: a closed-deck, steel and concrete aerial track structure with welded rail. The moderate and severe noise impact contour distances for the West Option are the same as for the East Option (see **Table 4-12**). **Figure 4-22** and **Figure 4-23** show the moderate and severe noise impact contours and clusters of affected noise-sensitive receivers associated with the West Option. The impact contours close in as they near the station areas because there would be less train noise as the trains decrease speeds when approaching stations.

Figure 4-23: Union Pacific Railroad Alternative West Option with Moderate (in Blue) and Severe (in Red) Impact Noise Contours (2 of 2)

Permanent Noise Impacts

Residential noise-sensitive receivers on the west side of the corridor would fall within the moderate and severe impact contours of this alternative. There are 738 noise-sensitive receivers within the moderate impact contour: 520 on the west side of the corridor and 218 on the east side of the corridor. A total of 48 noise-sensitive receivers lie within the severe impact contours; all are on the west side of the corridor. Receivers identified as displacements were not counted as being affected.

Impacts on noise-sensitive receivers within the moderate impact contour would occur throughout the majority of the corridor between 99th Street and the CN/ME tracks near 119th Street but with greater concentration along the west side of the corridor. There would be no noise-sensitive residential receivers within the severe impact contour on the east side of the corridor. On the west side of the corridor the noise-sensitive receivers within the severe and moderate impact contours are concentrated in the area northwest of the I-57/I-94 interchange and south of I-57 to 103rd Street. A row of noise-sensitive receivers is within the moderate impact contour between 103rd Street and 112st Street along the east side of Eggleston Avenue. Three churches could be subject to moderate impacts: the Soul Reviving Baptist Church (9837 Perry Avenue), the Kingdom Global Outreach Ministries (10132 S. Eggleston Avenue), and the Mt. Ebal Baptist Church (425 W. 107th Street). Clusters of noise-sensitive receivers fall within the moderate impact contour along both sides of the corridor between 112th Street and the CN/ME tracks near 119th Street. In addition, a few noise-sensitive receivers fall within the severe impact contour along the west side of the corridor between 112th Street and the CN/ME tracks near 119th Street.

The project could result in a severe impact on Wendell Smith Park and a moderate impact on Block Park and Kensington Park before mitigation. Because Fernwood Parkway is identified as a displacement it is not counted as being affected.

The property between State Street and Michigan Avenue south of 115th Street is vacant and there are no noise-sensitive receivers in this area along the corridor. The structures south of the UPRR tracks between State Street and Michigan Avenue are identified as displacements and therefore are not counted as receptors. No impacts are anticipated in the area south of the CN/ME corridor (which crosses the UPRR tracks near 119th Street), because there are no sensitive receivers there. Altgeld Gardens, which is southwest of the 130th Street station location, would not be affected because it falls outside the impact area. **Table 4-14** details the number of affected noise-sensitive receivers between station areas.

Table 4-14: Sensitive Receivers within Moderate and Severe Noise Impact Contours - Union Pacific Railroad Alternative West Option

Area of Impact	West of Track Structure	East of Track Structure=	Total
95th Street to 103rd Street	209 Moderate 32 Severe	81 Moderate 1 Severe	290 Moderate 33 Severe
103rd Street to 111th Street	125 Moderate 0 Severe	62 Moderate 0 Severe	187 Moderate 0 Severe
111th Street to Michigan Avenue at 116th Street	145 Moderate 9 Severe	47 Moderate 0 Severe	192 Moderate 9 Severe
Michigan Avenue to CN/ME Tracks near 119th Street	41 Moderate 7 Severe	28 Moderate 0 Severe	69 Moderate 7 Severe
Total	**520 Moderate** **48 Severe**	**218 Moderate** **1 Severe**	**738 Moderate** **49 Severe**

Noise impacts at affected receivers along the project corridor would require mitigation. The project could result in a moderate noise impact on four churches, one park, and residential areas along both sides of the rail corridor. The West Option could result in a severe noise impact on two parks and small, scattered residential areas along the west side along W. 98th Place, between 112th Place and 114th Street, between 115th Street and 116th Street, and between 117th Street and 118th Street. Although the schoolyard at Kwame Nkrumah Academy is within the moderate impact contour, the school building is outside the moderate impact contour; the school building would not have severe or moderate noise impacts. No other schools are within the severe or moderate noise contours.

Mitigation - As described for the East Option, to reduce noise levels below FTA noise impact criteria, CTA would construct a noise barrier approximately 4 feet in height to reduce noise transmission at and below track level. The 4-foot-high noise barrier would provide a 10-dBA reduction in noise along both sides of the elevated track structure from the 95th Street Terminal to the CN/ME tracks near 119th Street. All moderate or severe noise impacts would be resolved with mitigation. No moderate or severe impacts would remain after mitigation, including at Wendell Smith Park.

Permanent Vibration Impacts

The elevated track structure with continuously welded rail would result in vibration levels that would be below the FTA impact criterion of 72 VdB at the residential noise-sensitive receivers along the project corridor. The project would therefore result in no impacts from vibration and no mitigation measures would be required.

Construction Impacts

As it would be for the East Option, the West Option would include construction of an elevated track structure, stations, and parking facilities at the stations. Construction noise impacts would be the same as for the East Option. Construction noise levels are not expected to exceed the FTA-recommended construction noise limits shown in **Table 4-10**.

The construction contractor would employ noise-reducing construction BMPs as described for the East Option. As noted above for the East Option, it was determined from analysis that most of the equipment can be operated without risk of damage from vibration at distances of 15 feet or greater from non-engineered timber and masonry buildings or at distances of 8 feet or greater from reinforced concrete buildings. Pile-driving would be avoided in the vicinity of the historic Roseland Pumping Station.

Impacts Remaining After Mitigation

With a 10-dBA reduction provided by an approximately 4-foot-high noise barrier, all severe and moderate noise impacts would be resolved with mitigation. Beyond the use of noise-reducing construction BMPs, construction noise mitigation measures would not be required. There would be no vibration impacts; no mitigation measures for vibration are proposed.

4.6 Safety and Security

This section summarizes the safety and security impacts of the East and West Options. The *Safety and Security Technical Memorandum* (**Appendix P**) includes additional details.

Safety refers to freedom from harm resulting from unintentional acts or circumstances (49 CFR § 659.5). Unintentional acts or circumstances include all incidents within the CTA right-of-way (including areas along tracks, in yards, and at stations). Examples of incidents include collisions, derailments, fires, property damage, injuries, and fatalities. *Security* refers to freedom from harm resulting from intentional acts or circumstances (49 CFR § 659.5). Intentional harm includes crimes and must be reported if the intentional act meets thresholds for notification as specified in FTA's State Safety Oversight Rule (49 CFR § 674).

Table 4-15 summarizes safety and security impacts for the East and West Options.

Table 4-15: Safety and Security - Impacts Summary

Alternative	Permanent Impacts		Construction Impacts
	Safety	Security	
No Build	No impacts	No impacts	No impacts
Union Pacific Railroad - East Option	Impacts would not be adverse after mitigation	No adverse impacts	No adverse impacts
Union Pacific Railroad - West Option	Impacts would not be adverse after mitigation	No adverse impacts	No adverse impacts

4.6.1 Regulatory Framework/Methods

Federal safety and security requirements for rail systems are primarily provided in 49 CFR § 659, and through Occupational Safety and Health Administration (OSHA) standards and regulations for providing a safe and healthy workplace (namely the Occupational Safety and Health Act of 1970). Safety and security planning is included in the CTA's *System Safety Program Plan* and *Security Emergency Preparedness Plan*, both of which are required of CTA to comply with provisions under 49 CFR § 659. The CTA's *Infrastructure Design Criteria Manual* also addresses safety and security (CTA 2013b). The standards address system safety, security, fire protection, human factors, reliability, maintainability, configuration management, and quality control. Passenger safety is the highest priority in system safety objectives, along with the safety of CTA employees. Construction, installation, inspection, and testing procedures are also objectives covered by the standards.

For this Draft EIS, an adverse safety and security impact is defined as one that would cause one or more of the following:

- Creation of the potential for increased major safety or security incidents reportable to FTA
- Failure to meet the applicable design standards where such failure results in a safety or security impact
- Marked increase in safety or security risks on or off the CTA system
- Marked increase in pedestrian and/or public safety incidents in the immediate vicinity of proposed CTA stations
- Marked increase in crime incidents near proposed CTA stations
- Notable increases in calls for police service and/or emergency response time

4.6.2 Existing Conditions

The affected environment for this analysis includes areas that could be affected by impacts on the CTA system (e.g., tracks, vehicles, stations, rail yards) and impacts within ½ mile of stations. The ½-mile distance is used as an approximation of the distance most patrons will walk to a station and is therefore used when evaluating general pedestrian safety and security in the surrounding neighborhood.

Groups covered in the affected environment include transit passengers, operators, employees, contractors, and the general public. Members of these groups all come in contact with the system in some way, and could be susceptible to safety and security impacts. The main pedestrian safety risk in the project area is from motor vehicle crashes.

4.6.3 Environmental Consequences

The following sections summarize the potential safety and security impacts of each alternative.

4.6.3.1 No Build Alternative

There would be no permanent or construction-related safety and security impacts for the No Build Alternative.

4.6.3.2 Union Pacific Railroad Alternative - East Option

Permanent Impacts

The proposed stations would generate a large amount of pedestrian traffic, causing an increase in the number of pedestrians crossing streets to access the stations. At most stations, the controlled intersections (signals or all-way stops) nearest to proposed station locations are approximately one block away. It is likely that pedestrians would want to cross the streets immediately adjacent to station entrances, particularly to access the nearest available bus stops (assumed to be adjacent to stations). A large number of pedestrians would be expected to cross the major streets without positive traffic control (marked crosswalks or signalized intersections with pedestrian countdowns), which would be an adverse impact on pedestrian safety.

During the NEPA scoping process, the public expressed concern regarding the potential for increased crime surrounding proposed stations because of the higher volume of people accessing the stations. Based on data from transit stations in Chicago and across the United States, the new stations would be unlikely to have much, if any, impact on neighborhood crime (Plano 1993, Denver Regional Transportation District 2006, Liggett et al. 2003, San Diego Association of Governments 2007, Block and Davis 1996); however, research indicates that some risk would remain, particularly in low-income neighborhoods (Ihlanfeldt 2003).

Mitigation - CTA would prepare a Threat and Vulnerability Assessment, which would identify security threats in the transit system and make recommendations to reduce those threats. If warranted by an engineering traffic study, CTA may install traffic signals to mitigate pedestrian safety impacts. To further mitigate impacts and improve pedestrian safety, CTA would consider installation of security surveillance cameras, alarm notifications (e.g., flashing blue lights), sidewalk lighting in the immediate vicinity of station entrances, pedestrian crossing treatments, such as refuge medians with appropriate signage, and police patrols. To mitigate adverse safety impacts at the roadway-railroad grade crossings, CTA would install safety cameras and would consider installing additional passive or active safety devices to enhance the safety devices already in place at existing grade crossings. Additional audible warning devices or non-mountable curbs are examples of other safety measures for at-grade railroad crossings. CTA would install fencing to deter pedestrians from crossing the freight railroad tracks in places other than the designated locations. At the park & ride facilities, CTA would install surveillance cameras and controlled entry and exit access. The impacts would not be adverse after mitigation measures are implemented.

Construction Impacts

For any major capital project, CTA has a construction contract that requires the contractor to protect CTA's project site and all adjacent properties, and to take all necessary precautions for the safety of all persons on or near the project site. This requirement includes provisions to render all portions of the work secure in every respect and to decrease the possibility of, or liability for, accidents. The construction contractor would be required to have an approved Health and Safety Plan and a Safety and Security Plan in place before the start of any construction work. The Safety and Security Plan would describe protection to be provided by the contractor for its employees, CTA passengers and employees, and the general public. The project contractor would follow OSHA requirements and would comply with CTA's *Safety and Security Management Plan* (CTA 2011).

The elevated CTA rail line would be constructed adjacent to the existing, at-grade freight railroad line. Completing construction adjacent to an active freight rail line could create construction safety risks but impacts would not be adverse. The Safety and Security Plan would include the use of UPRR flaggers throughout the construction period, who would ensure that freight trains and on-track equipment pass safely through the work site without delays. The *Construction Impacts Technical Memorandum* (**Appendix I**) provides additional details regarding these potential impacts.

During the NEPA scoping process, CTA received comments regarding the ability of first responders to access construction sites and to have access through construction sites. The East Option would require lane closures on the expressways and temporary street closures during construction activities. Emergency services would have access to construction sites at all times and would access construction sites in the same way as contractors, by using various side streets and recommended detours. Emergency services wishing to cross tracks would have to use recommended detours, just as with any roadway construction project. The impacts would not be adverse.

During final design of the project and as a requirement for the project, CTA would prepare traffic management and maintenance of traffic plans that identify traffic detours and emergency access routes. CTA would coordinate traffic management with the FHWA, IDOT, Cook County Department of Transportation and Highways, the Office of Emergency Management and Communications, and CDOT. Contractors would follow the MUTCD design standards for temporary traffic control and would obtain all required local permits. Contractors would also create a public safety plan with local law enforcement officers for the construction site.

Impacts Remaining After Mitigation

Installation of new traffic signals and/or other pedestrian crossing treatments would reduce adverse impacts to a level that would be less than adverse. There would be no adverse permanent or construction-related impacts on safety and security for the East Option after mitigation measures are implemented.

4.6.3.3 Union Pacific Railroad Alternative - West Option

Permanent Impacts Remaining After Mitigation

The impacts for the West Option would be similar to those of the East Option. The park & ride facility locations would, however, differ from those of the East Option. The park & ride facilities for the West Option would be located on the same side of the railroad tracks as the proposed stations. These locations would result in fewer pedestrians crossing the railroad tracks than with the East Option. The presence of new stations adjacent to the roadway-railroad grade crossing would be an adverse impact at 103rd and 111th Streets. Like the East Option, the West Option would generate additional motor vehicle traffic and pedestrian traffic accessing the stations. The increase in traffic volume would result in increased likelihood of crashes at the roadway-railroad grade crossings. The increased likelihood of crashes would result in an adverse impact on the safety of the roadway-railroad grade crossings.

Mitigation - Mitigation measures would be same for the West Option as for the East Option. The impacts would not be adverse after mitigation measures are implemented.

Construction Impacts

The construction-related impacts would be the same for the West Option as for the East Option. As described for the East Option, the construction contractor would be required to have an approved Health and Safety Plan and a Safety and Security Plan in place before the start of any construction work.

Impacts Remaining After Mitigation

Installation of new traffic signals and/or other pedestrian crossing treatments would reduce adverse impacts to a level that would be less than adverse. There would be no adverse permanent or construction-related impacts on safety and security for the West Option after mitigation measures are implemented.

4.7 Historic and Cultural Resources

This section summarizes the draft findings under Section 106 of the National Historic Preservation Act (NHPA) and in coordination with the State Historic Preservation Office (SHPO) of the Illinois Historic Preservation Agency and consulting parties to the Section 106 process.

The structure of this section is slightly different than other sections in the Draft EIS, to fully document the process and consultation required under Section 106. In addition, the term "effects" is used in this section rather than "impacts" because of the unique requirements and terminology related to historic resources. The *Historic and Cultural Resources Technical Memorandum* (**Appendix Q**) includes additional details. **Table 4-16** summarizes the effect findings for historic and cultural resources.

Table 4-16: Historic and Cultural Resources - Effects Summary

Alternative	Effects
No Build	No effects
Union Pacific Railroad - East Option	No Adverse Effect finding for one resource
Union Pacific Railroad - West Option	No effects

4.7.1 Regulatory Framework/Methods

Cultural and historic resources are protected by various federal regulations; Section 106 of the NHPA requires federal agencies to consider effects on historic resources from their actions and to balance preservation needs with the need for the actions. As provided in 36 CFR § 800, the Section 106 process "seeks to accommodate historic preservation concerns with the needs of federal undertakings through consultation" (36 CFR § 800.1(a)). The goal of the consultation is to identify historic properties potentially affected by the undertaking, assess project effects, and seek ways to avoid, minimize, or mitigate any adverse effects on historic properties.

For the Section 106 assessment of historic and archaeological resources, FTA and CTA conducted a four-step process following requirements of 36 CFR § 800:

1. **Define the Area of Potential Effects** - FTA and CTA first determined an area of potential effects (APE) for cultural/historic resources. The APE is defined as the geographic area within which the project may cause alterations in the character or use of historic properties (36 CFR § 800.16(d)). Development of the APE involved site visits and a review of aerial photography images and conceptual engineering drawings for the alternative.

2. **Identify Historic and Archaeological Resources** - After an extensive records check, representative samples within the APE footprint were field-surveyed to identify any archaeological resources and historic resources that meet National Register of Historic Places (NRHP) criteria. Representative samples were used to determine effects on similar properties on a block-by-block basis. The properties included in the representative sample were determined using GIS databases provided by the City of Chicago, the Historic and Architectural Resources Geographic Information System, online mapping resources, SHPO records, and field visits. Additional details about the definition of the representative sample, and resources in it, are included in the *Historic and Cultural Resources Technical Memorandum* (**Appendix Q**). NRHP criteria are defined in 36 CFR § 60.4 and apply to districts, sites, buildings, structures, or objects that possess integrity of location, design, setting, materials, workmanship, feeling, and association with one or more of the following four criteria:

   - Criterion A - Events that have made a significant contribution to the broad patterns of American history on a federal, state, and/or local level

   - Criterion B - Lives of persons significant in the history of the city, state, and/or the United States

   - Criterion C - Distinctive characteristics of a type, period, or method of construction, or the work of a master, or high artistic values, or a significant and distinguishable entity whose components may lack individual distinction

   - Criterion D - Information important in prehistory or history

   FTA and CTA identified properties listed on the NRHP, local landmarks, and Chicago Historic Resources Survey (CHRS) “Red” and “Orange”-rated[6] buildings (properties with locally designated historic importance). FTA and CTA conducted background research to assist this process, using the Historic and Architectural Resources Geographic Information System and city records, fire insurance and other historic maps, the CHRS, previous architectural studies in the area, and other relevant scholarly publications. No properties or districts currently listed on the NRHP are present in the APE.

3. **Assess Effects on Historic and Archaeological Resources** - FTA and CTA assessed effects for each evaluated resource that was listed in the NRHP or determined eligible for listing. The effects analysis referenced other technical memoranda prepared for the project (for topics such as displacements, noise, and visual impacts) and focused on how

---

[6] The CHRS is an inventory of architecturally and historically significant buildings in the City of Chicago that uses a color-coded ranking system used to identify historic and architectural significance relative to age, degree of external physical integrity, and level of possible significance. The two highest color codes are "Red" and "Orange." These types of local historic resources are subject to the City of Chicago’s Demolition-Delay Ordinance. “Red” or “Orange”-rated properties were identified as possessing some architectural feature or historical association that made them potentially significant in the context of the surrounding community.

the alternative might alter the characteristics that qualify properties for inclusion in the NRHP.

4. **Resolve any Adverse Effects** - FTA and CTA will develop any necessary mitigation measures through consultation with the SHPO and other consulting parties to address adverse effect determinations.

A number of parties have a consultative role in a project considered an undertaking under Section 106. **Section 4.7.2** provides a summary of the consultation process conducted to date, as well as a list of invited and consulting parties.

4.7.2 Section 106 Consultation Process

In August 2012, FTA sent invitation letters to 11 Native American tribes to inform them of the process and request assistance in identifying areas with potential cultural and/or religious significance. Also in August 2012, CTA sent invitation letters to 19 state and local level preservation interest groups to inform them of the project and invite them to participate in the upcoming consultation process. FTA and CTA sent invitation letters to the following recipients:

Native American Tribes

- Ho-Chunk Nation
- Miami Tribe of Oklahoma
- Peoria Tribe of Indians of Oklahoma
- Sac and Fox Nation of Oklahoma
- Pokagon Band of Potawatomi Indians
- Prairie Band of the Potawatomi Nation
- Citizen Potawatomi Nation
- Forest County Potawatomi Nation
- Potawatomi Nation
- Sac and Fox Nation of Mississippi in Iowa
- Sac and Fox Nation of Missouri

State and Local Preservation Groups

- SHPO
- Advisory Council on Historic Preservation
- Illinois State Museum
- Illinois State Archaeological Survey
- City of Chicago Department of Planning and Development's Historic Preservation Division
- Preservation Chicago
- Landmarks Illinois
- Chicago Historical Society
- Ridge Historical Society
- Beverly Area Planning Association
- East Beverly Association
- Rosemoor Community Association
- Cottage Grove Cottage Grove Heights Community Coalition
- Historic Pullman Foundation
- South Suburban Genealogical and Historical Society
- Chicago Neighborhood Initiatives
- Neighborhood Housing Services of Chicago
- Mercy Housing Lakefront
- Friends of the Parks

At present, 11 groups are participating in the process. The consulting parties include the SHPO, the City of Chicago Department of Planning and Development's Historic Preservation Division, Preservation Chicago, Landmarks Illinois, the Ridge Historical Society, the Rosemoor Community Association, Friends of the Parks, Chicago Neighborhood Initiatives, Neighborhood Housing Services of Chicago, DCP, and the Chicago Park District.

On October 24, 2012, FTA and CTA held a webinar on RLE historic properties to introduce the project and initiate the consultation process. During the eligibility phase of consultation, properties and districts that were identified as eligible for listing on the NRHP were discussed. Properties over 50 years old in the APE were evaluated to determine whether they are NRHP-eligible under one of the four National Park Service Criteria for Evaluation mentioned above.

FTA and CTA provided draft materials on the identification of NRHP-eligible properties to consulting parties on January 4, 2013, in compliance with Section 106 of the NHPA. A 30-day comment period followed, with an in-person meeting on January 30, 2013 to facilitate discussion among consulting parties. The meeting was followed by an informal tour of the corridor that afternoon. As part of this phase of coordination, CTA received written comments from six consulting parties. Comments received from consulting parties in regards to eligibility focused on requesting additional surveys of resources, potential districts that should be considered recommended as eligible, reconsideration of surveyed properties and their eligibility, and the importance of looking at resources in the historical/social context.

As part of the eligibility phase, CTA surveyed 541 potentially eligible resources within the APEs for all alternatives being studied at the time (the BRT, UPRR, and Halsted Alternatives). As a result of the field investigations and comments received from consulting parties on potentially eligible resources, for the BRT, UPRR, and Halsted Alternatives, 15 total resources were identified as eligible for inclusion on the NRHP, including 13 individual buildings and 2 historic districts. Specifically for the UPRR Alternative, CTA surveyed 280 potentially eligible resources within the UPRR Alternative APE. As a result of the field investigations and comments received from consulting parties on potentially eligible resources, 7 total resources were identified for the UPRR Alternative as eligible for inclusion on the NRHP, including 6 individual buildings and 1 historic district.

FTA and CTA mailed a Draft Effects Report to consulting parties on April 18, 2014, requesting any written comments by May 23, 2014. On May 8, 2014, FTA and CTA met with consulting parties to discuss potential project effects on NRHP-eligible historic properties. CTA received written comments from four consulting parties. Comments received from consulting parties regarding assessments of effects included eligibility reconsiderations, effects reconsiderations, and requests for renderings for properties in the APE. Comments also related to effects associated with the Halsted Alternative and UPRR 130th Street West Station Option, both of which have been eliminated from further consideration (see **Section 2.4** for additional details).

From 2012–2014, CTA evaluated and took consulting party comments on four alternatives as part of the Section 106 consultation process: the No Build Alternative, the BRT Alternative (along Michigan Avenue), the UPRR Alternative, and the Halsted Alternative. CTA evaluated three options of the UPRR Alternative in the Section 106 consultation process: the Right-of-Way Option, the East Option, and the West Option. CTA also evaluated two options of the UPRR Alternative 130th Street station as part of the Section 106 consultation process: a South Station Option and a West Station Option. CTA developed separate APEs for each alternative and the Section 106 analysis and consultation was performed during 2012–2014 on all those alternatives and options.

In August 2014, based on the technical analysis and public input, CTA announced the NEPA Preferred Alternative—the UPRR Alternative. While CTA had originally considered a UPRR Right-of-Way Option, this option was subsequently removed, as it is no longer feasible. In addition, CTA is now considering only the South Station Option of the 130th Street Station. Further details on the alternatives evaluated and eliminated through the Draft EIS process are presented in **Section 2.4**. Additional conceptual engineering was conducted on the UPRR Alternative to refine the East and West Option alignments.

CTA provided responses to all consulting party comments received in May 2014 on November 24, 2014. Responses noted that the alternatives had been further narrowed and that the UPRR Alternative (East and West Options) were proposed to move forward as the NEPA Preferred Alternative. The consulting parties requested renderings at the Roseland Pumping Station and the 130th Street station near Altgeld Gardens. CTA has developed these renderings; they are included as **Figure 4-25** and **Figure 4-26**.

As noted above, CTA developed separate APEs for each alternative considered through the Section 106 consultation process. Based on the further narrowing of alternatives and additional conceptual engineering, FTA and CTA revised the APE accordingly as shown in **Figure 4-24**. The revised APE encompasses no new effects from the UPRR Alternative compared to what was presented during consultation. In correspondence to the SHPO dated September 21, 2016, and as described in **Section 4.7.4**, FTA described the revised project APE and made the determination that the UPRR Alternative (East and West Options) would result in no adverse effects. The September 21, 2016 correspondence to the SHPO is included in **Appendix Q**. The SHPO's concurrence with FTA's determinations is pending. Coordination with the SHPO will continue through the remainder of the project.

Appendix Q contains a full summary of the meetings, comments received, and responses to comments. The *Eligibility and Effects Summary Report* included as part of **Appendix Q** contains a concise summary of the NEPA Preferred Alternative APE as well as the eligibility and effects determinations made through the development of the project to date. In regards to the NEPA Preferred Alternative, information in the *Eligibility and Effects Summary Report* supersedes the eligibility and effects information provided in the text of the *Historic and Cultural Resources Technical Memorandum* (**Appendix Q**).

4.7.3 Existing Conditions

Figure 4-24 is a map of the revised APE and NRHP-eligible resources for the UPRR Alternative. Generally, the APE contains parcels within one block of the centerlines of the East and West Option alignments, as well as the areas immediately surrounding the park & ride and the yard and shop sites. Within the limits of the APE for the UPRR Alternative, CTA surveyed 280 individual resources. As a result of the field investigations and comments received from consulting parties on potentially eligible resources, 7 total resources were identified for the UPRR Alternative as eligible for inclusion on the NRHP, including 6 individual buildings and 1 historic district. **Table 4-17** summarizes historic resources within the APE. The *Eligibility and Effects Summary Report* (**Appendix Q**) contains a full description of the eligible resources within the APE as well as a discussion of historic and cultural resources that are locally designated.

7	Multiple (Public Housing Project)	Altgeld Gardens Historic District (built 1945)	Criterion A	Riverdale

NRHP = National Register of Historic Places

Beyond the NRHP-eligible resources, four properties within the APE are identified as notable "Orange" in the CHRS, three of which have also been identified as NRHP-eligible:

- Fire Department Engine Company 93 at 324 W. 104th Street (NRHP-eligible, ID #3)
- Roseland Pumping Station at 351 W. 104th Street (NRHP-eligible, ID #4)
- Romanesque Revival-style church at 10920 S. Princeton Avenue (NRHP-eligible, ID #5)
- St. Salomea Church at 11800–11808 S. Indiana Avenue

These CHRS "Orange"-rated resources are protected by the City's 2003 Demolition-Delay Ordinance. As none of the CHRS "Orange"-rated resources are proposed for demolition under either the East or West Option, this ordinance is not discussed further.

Eight public parks were also surveyed for potential NRHP eligibility, but none were found to be eligible. The *Historic and Cultural Resources Technical Memorandum* (**Appendix Q**) contains additional discussion on public parks surveyed.

A records search was conducted by cultural resource specialists and no known archaeological sites exist within the APE (see also **Appendix Q**). Although the landscape through which the transit lines would pass is developed, additional archaeological sites may remain undiscovered within protected locations such as parks and gardens. Once the project design has been further refined and before the Final EIS is published, archaeological investigations will occur within areas of ground disturbance for the selected option to determine whether potential resources are present. These investigations will follow the guidelines issued by the State of Illinois.

4.7.4 Environmental Consequences

Section 106 regulations state that if there are historic properties in the APE that may be affected by a federal undertaking, the agency official will assess adverse effects, if any, in accordance with the Criteria of Adverse Effect described in 36 CFR § 800.5. As stated in the regulation, an adverse effect is found when an undertaking may alter, directly or indirectly, any of the characteristics of a historic property that qualify the property for inclusion in the NRHP in a manner that would diminish the integrity of the property's location, design, setting, materials, workmanship, feeling, or association (36 CFR § 800.5(a)(1)). Effects can be direct, indirect, or cumulative (36 CFR § 800.5(a)(1)). The following sections summarize the potential effects on historic districts and properties that are eligible for NRHP listing. Effects are not separated into temporary construction and permanent categories because adverse effects on historic resources would be permanent regardless of whether they occur during or after construction of the project.

4.7.4.1 No Build Alternative

No adverse effects on historic and cultural resources would result from implementation of the No Build Alternative; therefore, no mitigation measures would be required.

4.7.4.2 Union Pacific Railroad Alternative - East Option

The East Option would cause displacements and visual, noise, and other environmental effects within the APE, but none of these effects would alter the characteristics that qualify any of the identified historic resources for inclusion on the NRHP. No mitigation measures would be required. Because none of the NRHP-eligible resources in the APE would be directly affected (they would not be displaced or altered), each resource was evaluated for potential visual effects from the aerial structure, stations, and parking facilities. **Table 4-18** summarizes the effects findings for each historic resource in the APE for both the East and West Options.

Table 4-18: NRHP-Eligible Resources in the Area of Potential Effects - Union Pacific Railroad Alternative East and West Options

ID	Description	Union Pacific Railroad Alternative East Option Effects Finding	Union Pacific Railroad Alternative West Option Effects Finding
1	Eclectic Neo-Traditional Home	No Historic Properties Affected	No Historic Properties Affected
2	Fire Department Engine Company 93	No Historic Properties Affected	No Historic Properties Affected
3	Roseland Pumping Station	No Adverse Effect	No Historic Properties Affected
4	Romanesque Revival-Style Church	No Historic Properties Affected	No Historic Properties Affected
5	Roseland Community Hospital Nurses Home	No Historic Properties Affected	No Historic Properties Affected
6	Former Venetian Hall	No Historic Properties Affected	No Historic Properties Affected
7	Altgeld Gardens Historic District	No Historic Properties Affected	No Historic Properties Affected

NRHP = National Register of Historic Places

Notes:

A “No Adverse Effect” determination is found when the project’s effects would not meet the criteria of adverse effect, the undertaking is modified, or conditions are imposed to avoid adverse effects, as described in **Appendix Q**.

A “No Historic Properties Affected” determination is found when the project would have no impact on a particular historic resource. This language is equivalent to the determination of “No Effect” as used in **Appendix Q**, but has been changed to be consistent with the official Section 106 determination documentation coordination with the SHPO.

Figure 4-25 is a photo simulation of the East Option track structure that would be adjacent to the Roseland Pumping Station. The track structure would be approximately 9 feet west of the Roseland Pumping Station at its nearest point. The final horizontal clearance would be determined in the design phase after property and topographic survey. The pumping station would not be displaced or directly affected by the UPRR Alternative; therefore, the East Option is anticipated to have no adverse effect. The resource was recommended eligible under Criterion C for its architecture as an excellent example of a well-preserved community pumping station designed in the Prairie Style that still functions in its original use. The building retains much of its original design, materials, and workmanship, including its projecting two-story flat-roofed entrance pavilion with geometric limestone details and coping. The proposed project would not affect these characteristics and would preserve the property’s entrance approach. The changes in setting and feeling brought on by the proposed project would not detract from the architectural aspects of the building that qualify the resource as eligible for NRHP listing. Pile-driving activities would be avoided in the vicinity of the pumping station.

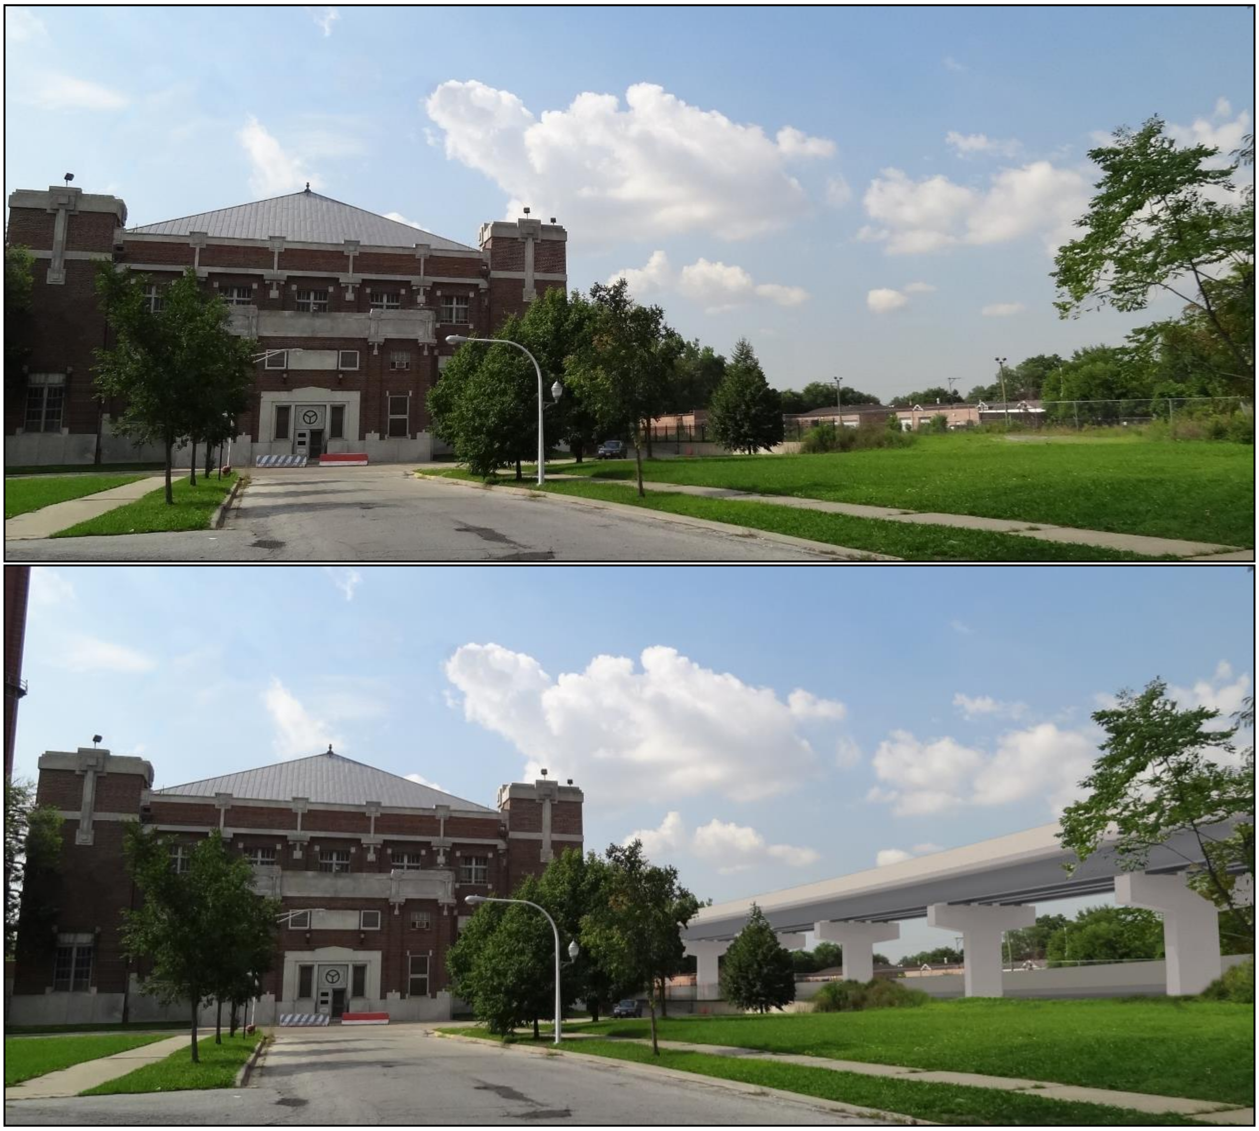

Figure 4-25: Photo of Existing Conditions and Photo Simulation of the Union Pacific Railroad Alternative East Option Elevated Track Structure adjacent to the Roseland Pumping Station, Facing South on Harvard Avenue

The 130th Street station would be approximately 800 feet from Altgeld Gardens Historic District at its closest point and the parking garage at the 130th Street station would be located at a distance away from Altgeld Gardens where the size of the structure would not create a visual impact; therefore, the 130th Street station and parking garage would not affect the Altgeld Gardens Historic District. **Figure 4-26** shows a view of the 130th Street station and parking structure from Altgeld Gardens.

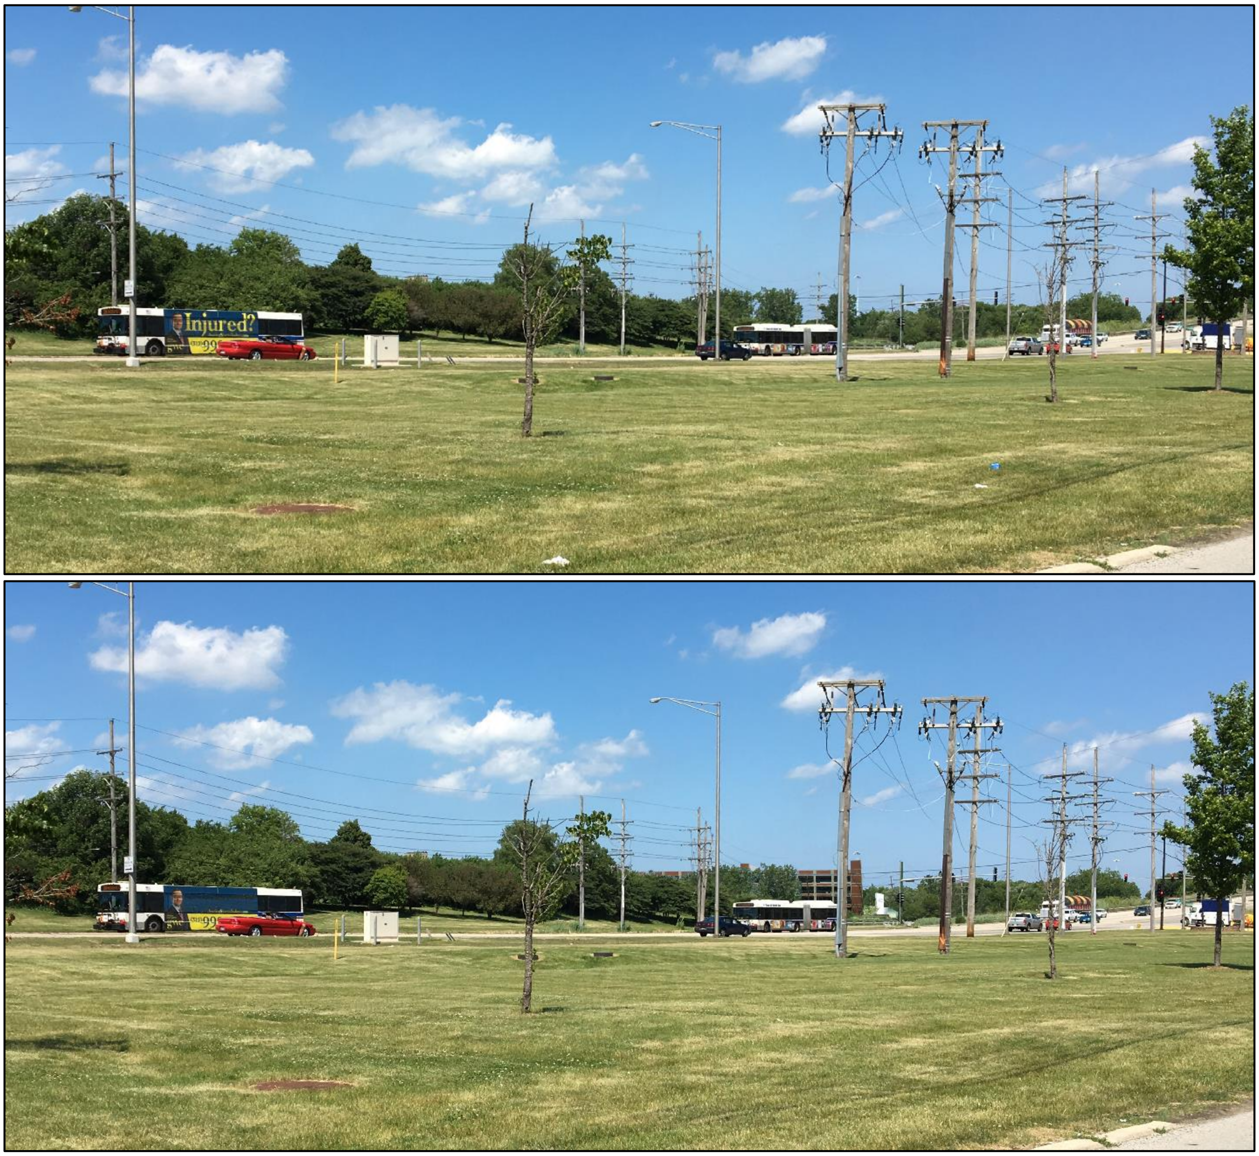

Figure 4-26: Photo of Existing Conditions and Photo Simulation of the 130th Street Station and Parking Garage, Facing Northeast on E. 130th Place

4.7.4.3 Union Pacific Railroad Alternative - West Option

Like the East Option, the West Option would cause displacements and visual, noise, and other environmental effects within the APE, but none of these effects would alter the characteristics that qualify any of the identified historic resources for inclusion on the NRHP. No mitigation measures would be required.

4.8 Hazardous Materials

This section summarizes the potential for encountering hazardous materials during operation and construction of the UPRR Alternative. Hazardous materials may include petroleum products, pesticides, organic compounds, heavy metals, asbestos-containing materials, lead-based paint, or other compounds that could harm human health or the environment (42 CFR § 9601). The nature and extent of contamination can vary widely. Early detection, evaluation, and determination of appropriate remediation of hazardous materials are essential to avoid or minimize the potential for hazardous material impacts from the project. The *Hazardous Materials Technical Memorandum* (**Appendix R**) contains additional details. **Table 4-19** summarizes the impact findings related to hazardous materials.

Table 4-19: Hazardous Materials - Impacts Summary

Alternative	Permanent Impacts	Construction Impact
No Build	No impacts	No impacts
Union Pacific Railroad - East Option	Benefits	No adverse impacts
Union Pacific Railroad - West Option	Benefits	No adverse impacts

4.8.1 Regulatory Framework/Methods

Although NEPA requires an evaluation of potential impacts related to hazardous materials, it does not define impact analysis thresholds for determining potential adverse impacts. For the purposes of this impact analysis, a hazardous material impact would be considered adverse if it would result in the following:

- Harm to human health or the environment through the routine transport, use, or disposal of hazardous materials
- Harm to human health or the environment through the accidental release of hazardous materials into the environment

Federal and state laws have been established for the protection of human health and the environment. At the federal level, the regulations include the following: the Resource Conservation and Recovery Act (RCRA) (40 CFR § 239–282); the Comprehensive Environmental Response, Compensation, and Liability Act (42 CFR § 9601); the Superfund Amendments and Reauthorization Act (42 CFR § 9601); the Clean Air Act (42 CFR § 7401); the Toxic Substances Control Act (15 USC § 2601); and the federal Occupational Safety and Health Act (29 USC § 651). At the state level, regulations and programs include the Illinois Environmental Protection Act and the Illinois Occupational Safety and Health Program, with oversight by the Office of the State Fire Marshal. Locally, the City of Chicago Police Department, City of Chicago Fire Department, and Department of Public Health regulate and oversee issues related to hazardous material.

A review of federal, state, and local regulatory databases was conducted by Environmental Data Resources, Inc. (EDR) to identify sites that currently or have historically handled, stored, transported, released, or disposed of hazardous or regulated materials, as these types of sites are potential sources of hazardous material contamination. In addition, historical Sanborn® fire insurance maps, topographic and aerial photographs, and other sources were reviewed for the analysis (EDR 2012a, Historical Information Gatherers, Inc. 2012a, 2012b, and 2012c).

Specific sites within ¼ mile of the project alignment, where hazardous materials are known or suspected to exist, were evaluated for the potential for hazardous materials to be present. Each site was assigned a level of concern based on the following criteria:

- **High Concern** - Sites with known/probable soil, groundwater, or soil gas contamination that have not been remediated, or where remediation was incomplete or undocumented. Other considerations include the type and mobility of any contamination, distance to the project, and groundwater impacts.

- **Moderate Concern** - Sites with known/potential soil, groundwater, or soil gas contamination and where remediation is in progress or was completed with restrictions in place, or contaminants do not appear to pose a concern for the project. Sites may also be considered a Moderate Concern based on the type and intensity of former land use (e.g., chemical manufacturers, machine shops, gas stations, laundromats), even though they did not otherwise have an environmental database listing.

- **Low Concern** - Sites where hazardous materials or petroleum products may have been or are stored, but where there is no known contamination associated with the property based on all available information. They may include hazardous material generator sites, sites with permitted air toxic emissions, or sites with spills or leaks that were subsequently remediated and are no longer a concern.

Polychlorinated biphenyls, lead-based paint, and asbestos-containing material are likely to occur in transformers and buildings constructed before 1978–1979. The evaluation of potential impacts associated with the other sources of hazardous materials was limited to determining whether transformers and buildings potentially constructed before 1978–1979 were present.

4.8.2 Existing Conditions

EDR conducted a search of federal, state, and local environmental regulatory databases on August 10, 2012 to identify potential sites of concern within ¼ mile of the project limits (EDR 2012b). Using the impact analysis criteria described above, CTA reviewed the sites identified by EDR and classified them as High, Moderate, or Low Concerns based on their potential to act as a source of contamination to the project. All sites not identified as High or Moderate Concern sites were classified as Low Concern sites. In addition, the list of orphan sites (sites reported as potentially being in the project area, but which could not be mapped due to inadequate or incomplete address information) was reviewed and when possible, classified. CTA used the historic research review and additional information requested from the Illinois Environmental Protection Agency (IEPA) on specific sites to determine the classification for each site.

The review identified 17 High Concern sites within ¼ mile of the East and West Option alignments (see **Table 4-20** and **Figure 4-27**). These sites have the highest potential to affect the RLE Project. The review also identified 18 Moderate Concern sites and 7 Low Concern sites near the alignment. Because it is unlikely that the Moderate and Low Concern sites would affect the RLE Project, they are not discussed here. **Appendix R** contains additional details about all identified sites.

Table 4-20: Identified High Concern Sites

EDR Site ID[1]	Map ID	EDR Database Site Name	Site Address	Approximate Separation Distance[2]	Databases[3]
8	8	Shell Oil Co.	4 E. 95th Street	250 feet (E and W)	LUST (No. 871758 Non-LUST deter.), UST (3 in use)

EDR Site ID[1]	Map ID	EDR Database Site Name	Site Address	Approximate Separation Distance[2]	Databases[3]
Orphan[4]	O3	Metro Sanitary District #3	125th Street and Doty Avenue	350 feet (E and W)	CERCLIS-NFRAP (archived)
Orphan[4]	O4	Penn Central Corp	810 E.124th Street	Within (E and W)	SSU (transferred to IEPA's Office of Site Evaluation)
		Lake Calumet Quad			CERCLIS-NFRAP (archived)

[1] Environmental Data Resources, Inc. (EDR) Site ID is the site ID number provided in the EDR database report included with the *Hazardous Materials Technical Memorandum*. More than one site has the same EDR Site ID; therefore, each High Concern site was given a unique “Map ID,” used in **Figure 4-27**.

[2] Separation distance is measured from the edge of the permanent envelope for an alternative. "Within" means the site would be inside the permanent envelope. E=East Option, W=West Option, NA = High Concern classification is not applicable to that option.

[3] The databases listed are those that contributed information relevant to the site’s designation as a High Concern site. See the *Hazardous Materials Technical Memorandum* (**Appendix R** of this Draft EIS) for more information.

[4] Orphan sites are reported as potentially being in the project area but could not be mapped due to inadequate or incomplete address information.

CERCLIS = Comprehensive Environmental Response, Compensation and Liability Information System, CESQG = conditionally exempt small quantity generators, ERNS = Emergency Response Notification System, IEPA = Illinois Environmental Protection Agency, LQG = large quantity generator, LUST = leaking underground storage tank, NFR = No Further Remediation, NFRAP = No Further Remedial Action Planned, NPL = National Priority List, PRP = potentially responsible party, RCRA = Resource Conservation and Recovery Act, SPILLS = Spill Incident List, SQG = small quantity generator, SRP = Site Remediation Program, SSU = State Sites Unit, UST = underground storage tank

The majority of these sites were classified as High Concern due to both their proximity (typically inside or within 500 feet of an alternative’s permanent envelope) and being listed in the Comprehensive Environmental Response, Compensation and Liability Information System (CERCLIS), or being listed as RCRA Corrective Action Sites, CERCLIS-No Further Remedial Action Planned Sites (CERCLIS-NFRAP), Illinois State Sites Unit Listing (SSU) sites, and/or as open Leaking Underground Storage Tank (LUST) sites or Site Remediation Program (SRP) sites. Open LUST or SRP sites have not been issued a No Further Remediation (NFR) letter from the IEPA, which indicates that a release has been identified but remediation is likely not complete.

Figure 4-27: Identified Sites of Concern

4.8.3 Environmental Consequences

The following sections summarize the potential impacts of each alternative from hazardous materials.

4.8.3.1 No Build Alternative

No adverse construction or permanent impacts related to hazardous materials would occur as part of the No Build Alternative. Potential benefits of remediation associated with the UPRR Alternative would not occur with the No Build Alternative.

4.8.3.2 Union Pacific Railroad Alternative - East Option

Permanent Impacts

CTA identified six High Concern sites (Map IDs 70, 104, 122, 151/162, 200, and O4) within the permanent envelope of the East Option, three of which (Map IDs 151/162, 200, and O4) are within the proposed 120th Street yard and shop site. In addition, CTA identified nine High Concern sites (Map IDs 8, 10, 81a, 103, 135, 143, 147a, O1, and O3) within approximately 1,000 feet of the edge of the permanent envelope for the East Option. Although these nine High Concern sites are not within the permanent envelope, based on their designation and proximity to the permanent envelope they are identified as High Concern.

Implementation of the East or West Option would result in benefits through the cleanup and/or removal of contaminated material (soil, groundwater, and/or asbestos and lead-based paint particles) during construction. Without implementation of a project alternative, this cleanup and removal would occur either at a later date or not at all.

The project’s daily operations or maintenance activities that require earthmoving in contaminated areas would have the potential to result in permanent hazardous material impacts from accidental spills or hazardous material releases. Spills are most likely to occur during activities such as equipment and grounds maintenance. Materials typically used for these activities include fuel, oil, paints, solvents, cleaning agents, herbicides, and pesticides. Examples of maintenance that could require earthmoving include at-grade track repair, underground utility work, and foundation repairs, although these activities are not expected to occur within the first 10–20 years.

The East and West Options also have the potential for additional hazardous material impacts associated with the NICTD/CSS & SBRR. Due to the proximity of the NICTD/CSS & SBRR to the UPRR Alternative alignments, hazardous material spills or releases that occur along these railroads would have the potential to migrate and affect the UPRR Alternative project area. These materials potentially exist along the railroad currently, but the UPRR Alternative would bring transit vehicles closer to them. Spills along the NICTD/CSS & SBRR could occur from the use of chemicals for ground maintenance along the tracks. In addition, because these are freight lines, releases could occur from creosote used to preserve wood railroad ties; polynuclear aromatic compound deposition from diesel exhaust; asbestos dust from brakes; and previous releases of coal ash from engines. Freight lines might also transport hazardous material cargo, which could be released if there were a spill or accident. Releases from adjacent freight lines could affect transit passengers or operations. If adjacent freight lines have a release of hazardous materials, transit operations may need to be stopped to avoid traveling through the release area. First responders would follow the procedures and protocols for hazardous materials incidents established by the Hazardous Materials Unit of the City of Chicago Fire Department.

Impacts associated with the adjacent freight lines would be reduced by the freight lines' adherence to federal hazardous material transport regulations (49 CFR § 171–180) that among other things, specify requirements for the safe transportation of hazardous materials by rail and require rail carriers to conduct a security and safety risk analysis, to develop a security and safety risk plan that includes measures to mitigate risk to population centers, and to select the safest route.

The East Option would not have permanent adverse impacts related to hazardous materials.

Mitigation - Although there would be no permanent adverse impacts related to hazardous materials as part of the East Option, CTA would adhere to all applicable federal, state, and local regulations, as well as existing system-wide hazardous material usage, storage, and disposal plans and procedures, further minimizing the potential for hazardous material impacts.

Construction Impacts

Construction of the East or West Option would include subsurface excavation, which would result in the generation of a large quantity of soil that could contain contaminated materials requiring off-site disposal. The source of the contaminated materials could be sites identified in the database, through the historic records review, or from the presence of urban fill. Hazardous materials typically used during construction, such as paints, solvents, fuels, and hydraulic fluids, could also be released accidentally during construction. In addition, there is the potential for encountering contaminated groundwater during construction.

Construction may require the demolition of existing structures that were likely constructed before 1978–1979. These structures may contain asbestos-containing material and lead-based paint that could result in a release of asbestos fibers and lead dust during construction.

The East Option would include construction within the UPRR corridor, which is potentially already affected because of its historic long-term use as a railroad corridor. Maintenance and operation of railroad corridors typically include the use of fuel, oil, paints, herbicides, pesticides, creosote, polynuclear aromatic hydrocarbons, and coal. High and Moderate Concern sites are the greatest potential sources of hazardous material impacts. There would be adverse construction-related impacts associated with the East Option but the impacts would be mitigated by implementing the BMPs and standard practices discussed below.

Mitigation - CTA would follow federal, state, and local laws and regulations regarding hazardous materials before and during construction. The following BMPs, at a minimum, would be implemented before and during construction to avoid and minimize the potential for impacts before and during construction:

- Phase I Environmental Site Assessments (ESAs) would be conducted of any property to be purchased as part of the selected option to identify recognized environmental conditions and assess and limit environmental liability. Phase I ESAs would be completed to evaluate the presence of contamination and to develop appropriate measures to deal with hazardous materials during construction. Based on the Phase I ESA findings, a Phase II ESA (or focused site assessment) could also be required before purchasing a property.

- Focused site assessments would be required for areas where earthmoving activities would occur and on properties purchased for the project. The assessments would include characterization and evaluation of the potential for encountering hazardous materials and contaminated soils.
- Asbestos, lead-based paint, and hazardous material surveys of buildings or structures would be required before reconstruction or demolition, to identify any asbestos, lead-based paint particles, and hazardous materials, such as polychlorinated biphenyl or mercury-containing equipment. Any asbestos, lead-based paint, and hazardous materials identified would be abated and disposed of in accordance with federal, state, and local regulations. Removal, abatement, and disposal of these materials will be completed by specialists that are trained and certified to conduct such activities.

The following specific and required plans would be developed before construction to further minimize or avoid the potential for hazardous material impacts:

- A Contaminated Material Management Plan that provides the procedures for identifying, characterizing, managing, storing, and disposing of contaminated soil and groundwater encountered during construction activities would be required. The plan would comply with all applicable federal and state cleanup standards and would cover the entire project area, as it is assumed that all material has at least some level of contamination associated with it.
- Spill Control and Prevention Plans to address the use, storage, and disposal of materials such as asphalt, fuel, paint, solvents, and cleaning agents would be required. The Spill Control and Prevention Plans would provide BMPs to limit the potential for accidental releases of potentially hazardous materials.
- Construction Stormwater Pollution Control Plans, which describe methods to prevent or minimize stormwater runoff from encountering contaminated soil or other hazardous materials, would be required.
- Health and Safety Plans for construction activities would be developed by the contractors and approved by CTA before starting any work. The Health and Safety Plans would identify potential contaminants of concern, required personal protective equipment and procedures, and emergency response procedures.

Construction-related impacts would not be adverse after the implementation of the BMPs and standard practices.

Impacts Remaining After Mitigation

After these BMPs and standard practices are implemented, the East Option would not have permanent or construction-related adverse impacts due to hazardous materials. Implementation of the East Option could also result in benefits through the cleanup and/or removal of contaminated material during construction.

4.8.3.3 Union Pacific Railroad Alternative - West Option

Permanent Impacts

Permanent impacts related to the West Option would be similar to those of the East Option with the exception that the West Option would operate adjacent to and west of the UPRR freight railroad. CTA identified six High Concern sites (Map IDs 51, 105, 122, 151/162, 200, and O4) within the permanent envelope of the West Option, three of which (Map IDs 151/162, 200, and O4) are within the proposed 120th Street yard and shop site. In addition, CTA identified nine High Concern sites (Map IDs 8, 10, 81a, 103, 135, 143, 147a, O1, and O3) within approximately 1,000 feet of the edge of the permanent envelope for the West Option. Although these nine High Concern sites are not within the permanent envelope, based on their designation and proximity to the permanent envelope they are identified as High Concern.

Due to the proximity of the UPRR and NICTD/CSS & SBRR to the UPRR Alternative alignments, hazardous material spills or releases that occur along these railroads would have the potential to migrate and affect the UPRR Alternative alignment, as described above for the East Option. These materials potentially exist along the railroad currently, but the UPRR Alternative would bring transit vehicles closer to them.

There would be no permanent adverse impacts associated with the West Option related to hazardous materials.

Construction Impacts

Construction-related impacts associated with the West Option would be the same as those described for the East Option. Construction-related impacts would not be adverse after the implementation of the BMPs and standard practices.

Impacts Remaining After Mitigation

After the BMPs and standard practices discussed in **Section 4.8.3.2** are implemented, the West Option would not have permanent or construction-related adverse impacts due to hazardous materials. Implementation of the West Option could also result in benefits through the cleanup and/or removal of contaminated material during construction.

4.9 Wetlands

This section describes the impacts of the East and West Options on potential wetlands. The *Water Resources Technical Memorandum* (**Appendix S**) includes additional details, along with the wetland delineation report. **Table 4-21** summarizes the impacts on potential wetlands.

Table 4-21: Wetlands - Impacts Summary

Alternative	Permanent Impacts	Construction Impacts
No Build	No impacts	No impacts
Union Pacific Railroad - East Option	Impacts would be mitigated through compensatory mitigation, if required.	Impacts would be mitigated through compensatory mitigation, if required.
Union Pacific Railroad - West Option	Impacts would be mitigated through compensatory mitigation, if required.	Impacts would be mitigated through compensatory mitigation, if required.

4.9.1 Regulatory Framework/Methods

Executive Order 11990 directs federal agencies to minimize the destruction, loss, or degradation of wetlands. It also assures the protection, preservation, and enhancement of the nation's wetlands to the fullest extent practicable during the planning, construction, funding, and operation of transportation facilities and projects.

The Illinois Interagency Wetlands Policy Act of 1989 (the Act [20 ILCS § 830 et seq.]) is intended to ensure that there is no overall net loss of Illinois' existing wetland acres or their functional values resulting from State-supported activities. The Act charges State agencies with a further duty to "preserve, enhance, and create wetlands where necessary to increase the quality and quantity of the State's wetland resource base." The Act uses the same definition for wetlands as in the 1987 U.S. Army Corps of Engineers (USACE) *Wetland Delineation Manual* used by federal agencies in implementation of the federal Clean Water Act. All three parameters (hydric [wet] soils, hydrophytic [growing in water] vegetation, and wetland hydrology) are required for a location to be considered a wetland; however, areas that have been restored or created as the result of mitigation or planned construction projects, and that function as wetlands, are also defined as wetlands under the Act even when all three wetland parameters are not yet present.

For this Draft EIS, an impact would be adverse if it would cause the destruction, loss, or degradation of wetlands, including any net loss of their functional values; or cause any discharges of dredged or fill material into wetlands.

CTA reviewed existing data sources to evaluate potential impacts on wetlands. Wetland data was obtained from the U.S. Fish and Wildlife Service National Wetlands Inventory (NWI). The NWI data is very general and is intended to give the user reconnaissance-level information. Several areas identified by NWI as wetlands in the project area were not deemed wetlands after the field review. To help locate wetland sites that may have been missed by the NWI, CTA used the U.S. Department of Agriculture (USDA) Natural Resources Conservation Service (NRCS) Web Soil Survey website, where available, to locate areas of potentially hydric soils. CTA also reviewed the Illinois Ecological Compliance Assessment Tool (EcoCAT) to identify resources mapped by Illinois Department of Natural Resources (IDNR).

CTA conducted a general field reconnaissance on August 8, 2012 to identify the potential presence and condition of wetlands within the project area. This reconnaissance-level wetland assessment confirmed the presence of potential wetland areas, and the potential extent was estimated from aerial photographs.

CTA contacted USACE in October 2012 for additional information about the wetlands in the vicinity of Lake Calumet. Many areas around Lake Calumet are highly disturbed and wetland delineation is difficult. USACE acknowledged that in many areas the soils are disturbed or imported and may not exhibit typical wetland characteristics. In these situations, USACE often relies on vegetation and hydrology as wetland indicators.

CTA conducted a field reconnaissance of the entire project area and identified potential wetlands in only the areas near the 130th Street station and the 120th Street yard and shop. CTA then completed a wetland delineation of the areas identified as containing potential wetlands and applied the general procedures detailed in the 1987 USACE *Wetland Delineation Manual* and the

2010 *Regional Supplement-Midwest Region*. Data collected included information on soils, hydrology, and vegetation. Surveys were conducted in August 2015, during the growing season, and vegetative species were identified.

During the wetland delineation, these areas were inspected, and data was collected on plant species and hydrology to identify wetland boundaries. In most cases in these areas, the existing gravel and fill precluded investigation of the soil profile; therefore, wetland delineations were based primarily on the presence of wetland vegetation and hydrology. The wetland delineation identified areas that meet the USACE criteria for wetlands.

A native vegetative quality rating was calculated for each wetland using the Floristic Quality Assessment (FQA) method (Swink and Wilhelm 1994). The FQA method calculates an index of the native vegetative quality for an area with higher values assigned to areas that support a greater preponderance of native plant species. Areas that are vegetated predominantly with nonnative or invasive species get a lower FQA value even though they may still meet the definition of a wetland.

The NEPA analysis would support the permit application and review in compliance with wetlands regulations as appropriate. Wetland delineations are generally only valid for 5 years because environmental conditions may change. If more than 5 years have lapsed at the time of permit application submittal, the wetland delineation would be reconfirmed concurrent with final design. In addition, wetland regulations at the federal, state, and local levels may change and some wetlands that may be considered isolated or part of a drainage system may or may not be regulated at the time of final design. Permit requirements would include the provision of compensatory mitigation if regulated wetlands would be affected. CTA will coordinate with the local USACE district. The analysis presented here and in the *Water Resources Technical Memorandum* (**Appendix S**) identifies potential wetland impacts; actual impacts would likely be smaller because additional measures to avoid impacts would be applied in final design. Design elements such as steeper side slopes on areas that need to be filled can often be applied during final design to reduce potential wetland impacts. Because the magnitude of these reductions cannot be predicted at this stage of design, the entire wetland area within the project footprint is assumed to be potentially affected.

Compensatory mitigation is required under the 2008 Clean Water Act Section 404 Final Compensatory Mitigation Rule for wetland impacts and is intended to replace lost aquatic resource functions and area with the goal of “no net loss” of wetlands (U.S. Environmental Protection Agency [USEPA] 2008). Compensatory mitigation should take place on public or private land at or adjacent to the impact site or at another location generally within the same watershed where it is most likely to replace lost functions.

4.9.2 Existing Conditions

Based on the results of the wetland delineation, CTA identified 15 wetland areas totaling 15.34 acres of potentially affected wetlands at the site of the 130th Street station and the 120th Street yard and shop, shown in **Figure 4-28** (see also **Appendix S**, *Water Resources Technical Memorandum*, for more detailed mapping of potential wetland impacts).

Figure 4-28: Wetland Delineation Map

The soils and topography near the site of the proposed 130th Street station and 120th Street yard and shop appear to be highly disturbed and likely include material imported from other locations. Railroad ties and potential slag were identified throughout the area. The compacted soils prevented the investigation of soil profiles or the identification of hydric soil characteristics; therefore, the wetland delineation was based primarily on the presence of wetland vegetation and hydrology in this disturbed area.

The area surveyed has flat topography; there were no obvious drainages and there were depressions with some standing water. The flat topography, combined with the highly compacted soils, likely holds water at the surface for the required two weeks in the spring growing season, leading to the preponderance of wetland vegetation observed. Wetland hydrology indicators observed included standing water or soil saturation in the root zone (in August 2015), sediment deposits, sparsely vegetated concave surfaces, water marks, algal mat or crust, water-stained leaves, and drainage patterns.

All wetland areas identified throughout this area are of low floristic quality and wetland function. Most of the wetlands are dominated by common reed (*Phragmities australis*), often in dense monotypic stands. There are no High Quality Aquatic Resources in the project area or mapped on adjacent properties. Fill and other manmade features define most of the wetland boundaries. On June 2, 2016, FTA and CTA requested a jurisdictional determination from USACE to determine whether the wetlands are jurisdictional under the Clean Water Act or are isolated wetlands of Cook County. Coordination with USACE is ongoing. Wetland boundaries will be reconfirmed at the time of the permit application, concurrent with final design.

4.9.3 Environmental Consequences

The following sections summarize the potential impacts of each alternative on wetlands.

4.9.3.1 No Build Alternative

There would be no permanent or construction impacts on wetlands as a result of the No Build Alternative.

4.9.3.2 Union Pacific Railroad Alternative - East Option

Permanent Impacts

The East Option could affect up to 15.34 acres of wetlands at the 120th Street yard and shop site and the 130th Street station site. The precise quantity of wetlands potentially affected would be reconfirmed based on the actual footprint to be determined in final design.

Mitigation - If there are jurisdictional wetlands and they cannot be avoided, CTA would provide compensatory mitigation. After compensatory mitigation, there would be no adverse permanent impacts on potential wetlands. The preference for compensatory mitigation would be to purchase credits from a mitigation bank or to participate in a USACE-approved in-lieu fee program. Approved mitigation banks would be reviewed at the time of final design to identify ones that include the project area in their service areas and which have available credits. If there are no suitable mitigation banks or in-lieu fee programs available, then compensatory mitigation would be provided through a mitigation project sponsored by CTA. CTA-sponsored compensatory mitigation would take place on public or private land at or near the impact site or at another location generally within the same watershed where it is most likely to replace lost functions. There are several areas associated with the Little Calumet River that appear to have been disturbed or filled by past industrial activities that could be restored as compensatory mitigation.

Impacts on wetlands would be mitigated through implementation of any of the potential compensatory mitigation measures discussed above.

Construction Impacts

Compensatory mitigation would be needed for construction-related, temporary impacts on wetlands. Construction staging areas would be sited outside of wetlands as much as possible, but if there were any temporary impacts, those areas would be restored as wetlands after construction.

Impacts Remaining After Mitigation

Impacts on wetlands would be mitigated through implementation of any of the potential compensatory mitigation measures discussed above.

4.9.3.3 Union Pacific Railroad Alternative - West Option

Permanent and construction impacts on potential wetlands, and associated mitigation, from the West Option would be the same as with the East Option because the potential wetlands would be within the common segment of the UPRR Alternatives; see the East Option **Section 4.9.3.2**.

Chapter 5
Indirect and Cumulative Impacts

While the other chapters of this Draft EIS provide analysis and findings on direct impacts of the project, NEPA also requires the consideration of the potential indirect and cumulative impacts of federally funded projects.

5.1 Regulatory Framework/Methods

Indirect impacts, also known as secondary impacts, are defined under 40 CFR § 1508.8. As defined, indirect impacts are caused by the project or plan, but are separated from direct impacts by time and/or distance (yet still in the foreseeable future). Indirect impacts include induced growth and related environmental impacts, such as changes to land use patterns, population density or growth rates, and related impacts on air quality, water and other natural systems. Cumulative impacts are defined under 40 CFR § 1508.7 as the aggregate result of the incremental direct and indirect effects of a project or plan, the effects of past and present actions, and impacts of reasonably foreseeable future actions by others on resources of concern.

CTA used the following guidance documents in determining the potential for indirect and cumulative impacts:

- *Consideration of Cumulative Impacts in EPA Review of NEPA Documents* (USEPA 1999)
- *Considering Cumulative Effects Under the National Environmental Policy Act* (Council on Environmental Quality [CEQ] 1997)
- *Guidance on the Consideration of Past Actions in Cumulative Effects Analysis* (CEQ 2005)
- *National Cooperative Highway Research Program (NCHRP) Report 466 - Desk Reference for Estimating the Indirect Effects of Proposed Transportation Projects* (Transportation Research Board 2002)

To determine the potential indirect impacts of this project, CTA followed the eight-step method described in the NCHRP Report 466. The project area boundary for the analysis was based on all proposed elements of the project, including construction limits and proposed property acquisitions. For the analysis, CTA reviewed the findings from the environmental resource analyses to properly evaluate the potential for indirect impacts on land use, transportation, and economic development plans and goals, as well as to identify notable or sensitive resources such as community facilities, historic resources, and other vulnerable or unique resources. The potential for and impacts of induced growth that could result from this project were then determined through a qualitative assessment of changes in growth and development expected as a result of the increases in transit accessibility from the project. Based on these factors, a determination was made on the potential and magnitude of impacts that could result from the project and whether those impacts would be consistent with surrounding growth, trends, and goals within the project area.

To identify the potential for cumulative impacts, CTA followed the 11-step method identified in CEQ guidance to meet best practice methods for conducting this type of analysis. Areas within ½ mile of the project corridor (consistent with other analyses conducted for this Draft EIS) were used to evaluate the potential for indirect effects. CTA reviewed applicable current and future regional and local plans.

5.2 Existing Conditions

The project area encompasses a diverse mix of land uses including residential, commercial, and light industrial as described in **Chapters 2, 3, and 4**.

Reasonably foreseeable projects include projects identified in *GO TO 2040*, the TIP, and known private development and redevelopment projects in the project area. The *Cumulative Impacts Technical Memorandum* (**Appendix T**) presents a list of projects in the project area and analyzes the potential cumulative impacts in more detail. CTA reviewed the FY 2014–2019 TIP database to determine whether any new projects would have the potential for cumulative impacts, as those projects were not included in the *Cumulative Impacts Technical Memorandum*. None of the FY 2014–2019 TIP projects would have the potential to have cumulative impacts with the RLE Project.

The specific projects discussed in this section have the potential for cumulative impacts when considered with the RLE Project. The projects that were considered were within the general RLE Project area, anticipated to be completed before the start of RLE Project construction in 2022, or that may be under construction during the RLE Project's proposed construction period of 2022–2026. Projects identified in *GO TO 2040* were also considered. The analysis was based on known projects from information available from CTA, the City of Chicago, CMAP, the Chicago Region Environmental and Transportation Efficiency Program (CREATE), IDOT, the Illinois State Toll Highway Authority, Metra, and NICTD.

Past, present, and reasonably foreseeable future actions within the project area that have the potential for benefits or impacts include the following:

- The CREATE 75th Street Corridor Improvement Project would provide improvements in the UPRR corridor. CREATE would increase freight volumes by its forecasted 2029 build year. Full implementation of CREATE would increase the number of passenger and freight trains using the UPRR tracks by 21 trains per day. CREATE projections include an increase in passenger trains from two to four trains per day by 2029 within the UPRR corridor.

- Metra's Southeast Service (SES) expansion project consists of 33.2 miles of proposed rail line from LaSalle Street station to a terminal near Balmoral Park. The rail line would run along the following four existing railroad rights-of-way: joint UPRR/CSX Transportation freight corridor from Balmoral Park to Dolton junction, UPRR from Dolton junction to Oakdale junction, Chicago Rail Link from Oakdale junction to Gresham interlocking, and Metra Rock Island District from Gresham interlocking to LaSalle Street station. Ten new stations and additional service at three existing stations (existing Rock Island District stations) are proposed. The SES would, if implemented, run along the UPRR tracks adjacent to the East or West Option alignment.

- NICTD is studying the West Lake Corridor Project, an approximately 9-mile alignment that would extend the NICTD South Shore Line from Dyer, Indiana to Hammond, Indiana. The project would connect with the existing NICTD South Shore Line and the ME Line, providing new transit service between Dyer and Millennium station in downtown Chicago. The West Lake Corridor Project alignment would run through the east side of the RLE Project area.

- The Red and Purple Modernization (RPM) Program is a series of proposed improvements to the North Red Line (from just north of Belmont station to the northern terminus of the Red Line at Howard station) and the Purple Line (from just north of Belmont station to Linden station). These improvements would increase passenger capacity and modernize transit stations, track systems, and structures along the 9.6-mile RPM corridor from just north of Belmont station to the northern terminus at Linden station, passing through the Lakeview, Uptown, Edgewater, and Rogers Park community areas of Chicago, the City of Evanston, and the Village of Wilmette.

- The Crown Commercial Real Estate & Development - Roseland Plaza redevelopment would be adjacent to the Michigan Avenue station location. The proposal includes a strip mall within a 91,000-square-foot property with 250 parking spaces. There would be 49,000 square feet of commercial space, which would include a grocery store, pharmacy, clothing store, and a bank. The City's Community Development Commission designated the developer in February 2005. The City approved the sale of its land and land write-down costs in May 2009. The developer modified its proposal and received approval of its Planned Development application from the Chicago Plan Commission in October 2011.

- The Pullman Historic District was declared a National Monument on February 19, 2015. The park is on the east side of the RLE Project area. The designation as a National Monument under the National Park Service is expected to bring economic opportunities to the surrounding communities.

5.3 Environmental Consequences

5.3.1 No Build Alternative

The No Build Alternative is defined as the existing transportation system plus any committed transportation improvements that are already in the FY 2014–2019 TIP. TIP projects consist of several road improvement projects including resurfacing and coordination of signal timing, work on Metra's ME district facilities to replace catenary lines, construction of a bicycle/pedestrian multi-use trail south of the project area, and preservation of historic facilities.

Indirect Impacts

The lack of improved transportation options and lack of new infrastructure would do little to reverse the disinvestment in the project area that has occurred over the past several decades.

Cumulative Impacts

The RPM Program, West Lake Corridor Project, and SES line are reasonably foreseeable actions that would result in beneficial air quality impacts because they would increase ridership, which would reduce trips made by vehicles. The cumulative impacts would result in a reduction of air emissions and would be beneficial. The air quality benefits of the No Build Alternative would be smaller in scale than for the East or West Option.

5.3.2 Union Pacific Railroad Alternative - East Option

Indirect Impacts

Implementation of the East Option would have the potential for indirect benefits to the project area economy. There would be potential for redevelopment from new employment accessibility, attraction of new development near RLE stations, and overall livability improvements. The private sector would likely perceive the East Option as a public-sector commitment to improve the overall project area and regain confidence in the area's economic development market. The retail and commercial space on the ground floor of the Michigan Avenue station's park & ride facility, combined with the proposed Roseland Plaza north of the station site, would help prompt greater social activity in the neighborhood and enhance the station's role as a focal point of community activity and services. The station and retail improvements may contribute to a southward expansion of the current commercial and entertainment district along Michigan Avenue between 111th and 113th Streets.

Cumulative Impacts

The CREATE 75th Street Corridor Improvement Project would provide improvements in the UPRR corridor. CREATE would increase freight volumes substantially by its forecasted 2029 build year. Because the UPRR freight traffic would remain and is projected to increase under the East Option, freight trains would have potential safety and accessibility impacts on pedestrian and vehicular traffic. The addition of more vehicular and pedestrian traffic accessing the proposed stations would increase the potential for safety and accessibility impacts near the proposed stations. Freight traffic could affect travel times for bus service to the station and could increase delays for passengers who choose to use the park & ride facilities. If the frequency of freight trains increases, the amount of time that the gates are down to accommodate the freight train movements would also increase, and vehicular traffic could be delayed while waiting for the trains to pass.

In addition to the expected increase in automobile and pedestrian traffic volumes as a result of the RLE Project when compared to the No Build Alternative, the full implementation of CREATE would increase the number of trains using the UPRR tracks from 27 to 48 per day (train volumes include both freight and passenger trains). The proposed Metra SES Project, if implemented, could also increase the number of passenger trains per day on the line beyond the existing two Amtrak trains per day. The increase in train volumes could correlate to an increase in potential crash frequency at highway-rail grade crossings. This increase in crash potential would be an adverse impact at the existing highway-rail grade crossings along the UPRR tracks at 101st Street, 103rd Street, 107th Street, 109th Street, 111th Street, Wentworth Avenue, 115th Street, and State Street. All of these crossings currently have gates on both roadway approaches and have flashing lights. Crash potential could be further mitigated by installing safety protection technologies for vehicles to prevent drivers from going around the gates. If warranted by an engineering traffic study, CTA may install traffic signals to mitigate pedestrian safety impacts. To further mitigate impacts and improve pedestrian safety, CTA would consider installation of security surveillance cameras, alarm notifications (e.g., flashing blue lights), sidewalk lighting in the immediate vicinity of station entrances, pedestrian crossing treatments, such as refuge medians with appropriate signage, and police patrols. To mitigate adverse safety impacts at the roadway-railroad grade crossings, CTA would install safety cameras and would consider installing additional passive or active safety devices to enhance the safety devices that are already in place at the existing grade crossings. Additional audible warning devices or non-mountable curbs are examples of other safety measures for at-grade railroad crossings. CTA would install fencing to deter pedestrians from crossing the freight railroad tracks in places other than the designated locations.

The West Lake Corridor Project would run through the east side of the RLE Project area and might accommodate a future connection between the NICTD South Shore Line and the Red Line near the 130th Street station. The combination of the RLE Project and the West Lake Corridor Project would provide additional transit options for people commuting to downtown Chicago.

The RPM Program, West Lake Corridor Project, and SES line are reasonably foreseeable actions that would result in beneficial air quality impacts because they would increase ridership, which would reduce trips made by automobiles. The cumulative impacts with the implementation of the East Option would result in a reduction of air emissions and would be beneficial.

The permanent cumulative impacts of these projects would be beneficial to the surrounding communities because they would improve access to jobs, places of interest, and residences. The potential for an increase in crash frequencies at the at-grade crossings would be mitigated by installing additional grade crossing protection that would prevent vehicles and pedestrians from going around the crossing gates. CTA anticipates the incremental impact from reasonably foreseeable future actions to be more efficient mobility and access to jobs, retail, and places of interest within the project corridor for Chicago residents and visitors. CTA expects that over a period of time retail establishments and places of interest would benefit from the more efficient access to their locations.

5.3.3 Union Pacific Railroad Alternative - West Option

Indirect Impacts

The indirect impacts under the West Option would be the same as those described for the East Option.

Cumulative Impacts

Cumulative impacts with the West Option would be similar to those of the East Option; however, it is anticipated that vehicular and pedestrian impacts would be fewer than with the East Option based on the locations of the park & ride facilities in relation to the proposed station areas.

Chapter 6
Resources with Limited or No Adverse Impacts

This chapter describes the environmental resource categories for which the RLE Project would have limited or no adverse impacts. Based on the nature of these resource areas, impacts would be similar for both the East and West Options and are therefore discussed together.

Section 6.1 Air Quality
Section 6.2 Water Quality
Section 6.3 Floodplains
Section 6.4 Vegetation and Wildlife Habitat
Section 6.5 Threatened and Endangered Species
Section 6.6 Geology and Soils
Section 6.7 Energy

6.1 Air Quality

Under authority of the Clean Air Act (42 USC § 7401) and its amendments, the USEPA has established National Ambient Air Quality Standards (NAAQS) for criteria pollutants to protect the public health and welfare. The IEPA maintains a statewide network of monitoring stations that continuously measure pollutant concentrations in the ambient air. These stations provide data to assess compliance with the NAAQS and the Illinois Ambient Air Quality Standards (IAAQS) and to evaluate the effectiveness of pollution control strategies. The maximum ambient concentrations for these pollutants were measured at representative monitoring stations nearest the project corridor for calendar year 2011. Except for one exceedance of the 8-hour ozone (O_3) at the Lawndale Street station, there were no exceedances in the project area of any of the NAAQS or IAAQS in 2011.

Because the RLE Project is in a "Moderate" O_3 nonattainment area, it is FTA's responsibility, as the federal funding agency, to ensure that the proposed project conforms to the Illinois State Implementation Plan. Conformity is demonstrated by showing that the proposed project is included in a conforming Regional Transportation Plan and a TIP. The RLE Project is included in a conforming Regional Transportation Plan, CMAP's *GO TO 2040*, and a corridor-wide emissions inventory analysis. It is therefore not necessary to demonstrate transportation conformity at the regional level. An air quality assessment of the localized air quality impact of the UPRR Alternative was completed because the project is adding new service that could change local vehicle miles traveled[7] (VMT) and emissions.

Because nearly all of the project-related air pollutant emissions would come from motor vehicles and because the project-related motor vehicles would move throughout the entire project area, the results of the air quality analysis apply equally to the East and West Options, as well as to the 120th Street yard and shop. That is, it makes no difference in the analysis whether the Red Line trains would be on the east side or on the west side of the UPRR right-of-way; the pollutant emissions would be the same in each case. In addition, the air pollutant emissions associated with the 120th Street yard and shop would not be substantial. The UPRR Alternative, both East and West Options, are therefore discussed together here.

---

[7] Annual VMT, which is an output of CMAP's Regional Travel Demand Model (CMAP 2012c), is the total number of miles driven by all vehicles during 1 year in a defined a geographic area.

CTA trains run on electricity; therefore, they cause no direct emissions. Their electricity comes from the electric utility grid, which may include local, fossil-fueled power plants. An increase in indirect emissions due to electrical power consumption by the Red Line trains would be expected with the UPRR Alternative. The UPRR Alternative would not result in an exceedance of the carbon monoxide (CO) standards, and because its implementation would reduce VMT, it would therefore slightly improve greenhouse gas (GHG) emissions, particulate matter with an aerodynamic diameter of 2.5 micrometers and less ($PM_{2.5}$) impacts, and mobile source air toxics emissions as compared to the No Build Alternative.

CTA conducted CO dispersion modeling at three “worst-case” intersections, based on LOS and total traffic volumes in 2030 during the peak hour, as required by USEPA guidance (USEPA 1992). The maximum 1-hour and 8-hour CO concentrations were compared to the NAAQS for CO to determine impacts. Modeling determined that the UPRR Alternative alignment would not exceed the federal standards of 35 parts per million (ppm) for the 1-hour concentration or 9 ppm for the 8-hour concentration.

CTA conducted a quantitative assessment of project-related GHG benefits and/or impacts on climate change to reflect the changes in GHG emissions based on differences in VMT, travel speed, fuel consumption, and delay along the project corridor (see **Appendix U** for additional information). The quantitative assessment determined that the East and West Options would have slightly lower estimated GHG emissions as compared to the No Build Alternative.

Emissions from construction equipment would occur during site preparation activities such as grading, installing curbs, or grubbing and removal of vegetation to prepare a site for construction. Impacts during construction would be primarily associated with fugitive dust and emissions from on-road and non-road vehicles. The equipment producing these emissions could include haul trucks, concrete trucks, front-end loaders, excavators, cranes, drill rigs, compressors, flatbed trucks, and generators. Short-term exposure (i.e., 1-hour averaging period) to nitrogen dioxide (NO_2) can worsen the effect of allergens in allergic asthmatics and can contribute to atmospheric discoloration. Long-term exposure (i.e., annual averaging period) can lead to increased respiratory symptoms and medication use in asthmatics, emergency room visits for asthma in children, hospitalization for respiratory and cardiovascular disease, and premature mortality. IEPA has strict guidelines for controlling fugitive dust (by BMPs), diesel particulate emissions (by exhaust emission controls and use of low-sulfur fuels), and GHG emissions (by limiting equipment operations such as excessive idling and by using alternative fuels). In addition, the contractor would follow Chicago’s Clean Diesel Construction Ordinance, which would further reduce the potential for construction-related air quality impacts.

Construction activities can also result in traffic disruption, rerouting, and temporary shutdown of traffic. Traffic disruption, such as detours or decreased roadway capacity, can lead to increased traffic congestion, thereby increasing motor vehicle exhaust emissions on nearby roadways, and resulting in elevated localized pollutant concentrations.

Mitigation - The following mitigation measures would be implemented:

- Work would be sequenced to minimize air quality impacts on adjacent roadways and commercial and residential buildings due to traffic disruptions during construction. Alternate routes would be planned for construction-related truck traffic, creating temporary detours for regular roadways where capacities have been diminished, providing traffic control, routing trucks away from residential neighborhoods, and restricting construction activities during hours of high traffic volumes on the existing roadways. Contractors would also consider locations of schools, parks, and daycares when deciding where to route local traffic and construction equipment, and to the extent possible, route traffic away from places where children congregate.
- A Dust Control Plan would be prepared to address in detail how dust would be controlled at the construction site, the staging areas, and the access and egress routes.
- All diesel-powered equipment and vehicles would be required to be retrofitted with emissions control devices and to use ultra-low-sulfur diesel fuel (15 ppm sulfur maximum) to control diesel particulate emissions.
- Contractors would retrofit engines with an exhaust filtration device to capture diesel particulate matter before it enters the construction site.
- Contractors would position the exhaust pipe so that diesel fumes are directed away from the operator and nearby workers, reducing fume exposure for personnel.
- Contractors would use catalytic converters to reduce CO, aldehydes, and hydrocarbons in diesel fumes. These devices must be used with low-sulfur fuels.
- Contractors would use enclosed, climate-controlled cabs pressurized and equipped with high-efficiency particulate air filters to reduce the operators' exposure to diesel fumes. Pressurization ensures that air moves from inside to outside. High efficiency particulate air filters would filter incoming air.
- Contractors would regularly maintain diesel engines, which is essential to keep exhaust emissions low. Contractors would follow the manufacturer's recommended maintenance schedule and procedures.
- Contractors would reduce exposure through work practices and training, such as turning off engines when vehicles are stopped for more than a few minutes, training diesel-equipment operators to perform routine inspection, and maintaining filtration devices.
- Contractors would repower older vehicles and/or equipment with diesel- or alternative-fueled engines certified to meet newer, more stringent emissions standards. Contractors would purchase new vehicles that are equipped with the most advanced emission control systems available.
- Contractors would use electric starting aids such as block heaters with older vehicles to warm their engines to reduce diesel emissions.

- CTA would require the contractor to develop a plan (including a truck queuing plan) and schedule to allow construction trucks to enter and exit the construction sites and staging areas without excessive disruption and impacts on residences and commercial establishments.

The UPRR Alternative would not have permanent adverse air quality impacts. With the use of appropriate construction-related mitigation measures as described above, no violations of the IAAQS or NAAQS would be anticipated for the UPRR Alternative. With appropriate mitigation measures in place, no adverse air quality impacts due to construction activities would be anticipated with this alternative. The *Air Quality Technical Memorandum* (**Appendix U**) contains additional details.

6.2 Water Quality

The Clean Water Act (33 USC § 1251) establishes the basic structure for regulating discharges of pollutants into waters of the United States and gives the USEPA the authority to implement pollution control programs and actions, such as setting wastewater standards for industries. Section 10 of the Rivers and Harbors Act of 1899 (33 USC § 403) prohibits the unauthorized obstruction or alteration of any navigable water of the United States. Sole source aquifers are regulated under 40 CFR § 149.

Lake Michigan is the dominant topographic feature in the region and is approximately 4.8 miles from the project area at its closest point near the UPRR Alternative alignment. Lake Calumet is in the eastern portion of the project area, and the Little Calumet River flows west along the southern boundary of the project area. The Little Calumet River is on Illinois 303(d) list (a list of waters where water quality is impaired or threatened); it is listed as impaired for mercury, polychlorinated biphenyls, aldrin, iron, dissolved oxygen, total phosphorus, and silver (IEPA 2012). IEPA has not yet developed a Total Maximum Daily Loads analysis for this segment of the Little Calumet River system. Neither the East Option nor the West Option would cross or come in contact with any local water bodies.

Lake Michigan is the drinking water source for Chicago and its suburbs. Groundwater is not a drinking water source and there are no sole source aquifers within the project area (USEPA 2012). Due to the predominance of impervious surfaces throughout the project area, minimal percolation to the underlying groundwater occurs. **Figure 6-1** shows waterbodies near the project area.

Figure 6-1: Waterbodies and Floodplains in the Project Area

The No Build Alternative would have no adverse impacts on water resources. The East or West Option would have minimal adverse impacts on water resources. Stormwater drainage may be affected by the proposed structure; however, the alterations would not greatly affect the direction of drainage. Dewatering activities during construction could temporarily affect local groundwater levels. Contaminated groundwater encountered during construction would be disposed of properly in accordance with federal, state, and local regulation. Construction could increase erosion and sedimentation near construction areas. The use of construction BMPs would mitigate these potential impacts. The project would involve reconstruction of impervious surfaces, but would not result in a net change of impervious area, because the project area is heavily urbanized. While the potential exists for minor construction-related impacts, as described above, the East and West Options would have few or no adverse impacts on water quality; therefore, no mitigation measures would be required beyond BMPs currently followed by CTA.

The *Water Resources Technical Memorandum* (**Appendix S**) contains additional details.

6.3 Floodplains

Presidential Executive Order 11988 requires the protection of floodplains. The Executive Order directs federal agencies to avoid conducting, allowing, or supporting actions on a floodplain. The existing floodplains within the project area have been identified using the Federal Emergency Management Agency Flood Insurance Rate Maps. **Figure 6-1** shows the mapped floodplains within the project area. The UPRR Alternative would not cross a floodplain or result in any new structures or construction in a floodplain. Flooding would not affect the project. There would be no impacts on floodplains from the East or West Option.

6.4 Vegetation and Wildlife Habitat

Vegetation and wildlife habitats are regulated on the federal level by the Endangered Species Act (16 USC § 1531), Migratory Bird Treaty Act (16 USC 703–712), Fish and Wildlife Coordination Act (16 USC § 661–667e), and the Bald and Golden Eagle Protection Act (16 USC § 668–668c).

The vegetation and wildlife habitat investigation assessed existing biological resources in the project area and evaluated potential impacts on these resources. CTA reviewed the IDNR EcoCAT report to identify special-status plants and animals and Illinois Natural Areas Inventory (INAI) sites with the potential to occur in the project area (IDNR 2012). The IDNR EcoCAT database identified the Lake Calumet INAI Site near Lake Calumet east of the UPRR Alternative alignment. There are no national wildlife refuges within 0.5 mile of the East or West Option alignments (U.S. Fish and Wildlife Service 2012b).

CTA reviewed aerial photographs and identified all areas within ¼ mile of the UPRR Alternative alignment that appeared to contain approximately ½ acre or more of contiguous habitat cover. (In a heavily urbanized area, ½ acre provides a minimum amount of cover where wildlife not generally found in residential yards might be found.) During the field investigation, CTA visited and evaluated all of these areas. With the exception of the forested habitats (approximately 13 acres) in the vicinity of the 120th Street yard and shop site, it was determined that none of these areas would support wildlife communities that are substantially different from those of the surrounding residential and commercial areas.

The East and West Options have the potential to require the removal of trees. Trees occur in a narrow band immediately adjacent to the proposed track location, in the vicinity of the proposed 120th Street yard and shop, and at properties along the alignment. The narrow bands of trees along the northern portion of the alignment have a lower value to wildlife than blocks of habitat; therefore, removal of these bands of trees would have minimal impacts on wildlife. Along the southern portion of the alignment, the East and West Options have the potential to affect blocks of habitat. The East Option would affect approximately 61 acres of potential habitat and the West Option would affect approximately 67 acres of potential habitat. Tree removal in any part of the project area might affect birds protected under the Migratory Bird Treaty Act (16 USC § 703–712), and depending on what part of the project area the trees are in, tree removal might also be regulated by local ordinances. When applications for local construction permits are made it may be necessary to prepare more detailed tree inventories and update the results of this investigation because some trees may have been removed and others may have grown to a size that would be protected by local tree ordinances.

The East and West Options would have the potential to have adverse impacts on vegetation and wildlife habitat during construction due to tree removal; however, with the implementation of mitigation measures outlined below, potential impacts would not be adverse. Mitigation measures would be required for compliance with the Migratory Bird Treaty Act, for consistency with local tree protection ordinances, and to reduce potential impacts on wildlife habitat. Bird species may use trees that could be removed or disturbed during construction and could be affected. Potential mitigation measures would include the following:

- Tree removal would be timed as much as possible to occur outside the migratory bird nesting season, which occurs generally from April 1–September 15 and as early as March 1 for some species.

- If tree removal must occur during the nesting season, two biological surveys would be conducted: one 15 days before and a second 72 hours before the construction that would remove or disturb suitable nesting habitat. The surveys would be performed by a biologist with experience conducting breeding bird surveys. The biologist would prepare survey reports documenting the presence or absence of any protected bird in the habitat to be removed and any other such habitat within 300 feet of the construction work area. If a protected bird were found, surveys would be continued to locate any nests. If an active nest were located, construction within 300 feet of the nest would be postponed until the nest is vacated and juveniles have fledged and when there is no evidence of a second attempt at nesting.

- Avoidance measures would be incorporated into the design of the project during preliminary engineering where feasible; however, if construction of the project were to require removal of a protected tree, a permit would be required in accordance with applicable codes and ordinances of the City of Chicago. Tree removal permits may require replanting of protected trees within the project area or at another location to mitigate for the removal of these trees. Replanting would be done according to the ratios required by tree removal permits and in a size that is appropriate for the species and setting as determined by an arborist. In addition, planted trees would be maintained such that 90 percent are in good condition after 6 months and irrigation would be carried out until the tree is established.

The *Biological Resources Technical Memorandum* (**Appendix V**) contains additional details.

6.5 Threatened and Endangered Species

The Endangered Species Act (16 USC § 1531) and subsequent amendments provide for the conservation of threatened and endangered species and the ecosystems upon which they depend. There are 114 federal- and state-listed species that potentially occur in Cook County (U.S. Fish and Wildlife Service 2012a). CTA also reviewed the IDNR EcoCAT report for information about known occurrences of listed species within the project area. The IDNR EcoCAT database recorded occurrences of seven state-listed species within the sections that encompass the project area, including black-crowned night heron (*Nycticorax nycticorax*), Blanding's turtle (*Emydoidea blandingii*), common moorhen (*Gallinule chloropus*), little blue heron (*Egretta caerulea*), peregrine falcon (*Falco peregrinus*), yellow-crowned night heron (*Nyctanassa violacea*), and yellow-headed blackbird (*Xanthocephalus xanthocephalus*). These recorded occurrences were not within the project area, so CTA compared each species' habitat requirements to the existing habitats within the project area. CTA conducted reconnaissance-level field verification of identified habitat areas to confirm the presence or absence of threatened and endangered species and their habitats within the project area. The field investigation included parks and other public open spaces within ¼ mile of the proposed alignment, stations, and maintenance yard.

CTA identified no federal-listed species in the project area. The only state-listed species with a potential to occur in the project area is the peregrine falcon. There is no suitable habitat for species identified by the EcoCAT database in the project area except for the peregrine falcon. There are no known nesting pairs of peregrine falcons in the project area (Field Museum 2015). In addition, there is no part of the project area that would be expected to provide unique or particularly rich foraging habitat for peregrine falcons. The semi-natural habitats in the vicinity of the 120th Street yard and shop site, and large parks and open spaces might, however, be expected to provide slightly greater foraging opportunities for falcons than elsewhere in the project area.

Neither the East nor West Option would have adverse permanent or construction-related impacts on state- or federal-listed animal and plant species. No mitigation measures for listed species would be required. The *Biological Resources Technical Memorandum* (**Appendix V**) contains additional details.

6.6 Geology and Soils

CTA reviewed existing data on geology, soil, and topography to understand the general geologic setting and identify the locations of geologic hazards that could result in substantial damage to structures or infrastructure or could expose people to substantial risk of injury and to determine potential impacts of the East and West Options. CTA reviewed soil boring and water well logs, geologic maps of Cook County and of Illinois published by the Illinois State Geological Survey, U.S. Geological Survey (USGS) topographic maps, and geologic maps and reports from USDA NRCS. To identify adverse impacts, CTA also considered the project area's proximity to any identified geologic hazards and the potential severity of those hazards. The potential for impacts exists because earthwork activities (such as excavation and grading that occur during construction) can cause soil erosion, affect soil stability, and create topographic disturbances. Potential adverse impacts due to ground settlement, which can occur during both construction and operation, were also considered.

Local topography is generally flat and typically varies less than 50 feet, with a minimum elevation of 590 feet and a maximum elevation of 625 feet above sea level. Bedrock underlying the project area is present at variable depths, ranging from 50 to 100 feet below ground surface. The region has been subjected to tectonic movements; however, the local area does not show evidence of faults or substantial earthquakes (USGS 2002). The project area is underlain by urban land complexes, which are identified as soil that has been disturbed (such as fill material) (USDA NRCS 2012). CTA would perform a geotechnical investigation as part of the preliminary design of the selected option. Some aspects of preliminary plans and design may need revisions based on results of the geotechnical investigation.

Operation or construction of the East or West Option would not have adverse impacts on geologic or soil resources, because all of the features of the options would be located primarily on or within existing transportation use areas such as streets and railroad corridors. No mitigation measures would be required.

6.7 Energy

The Energy Policy Act of 2005 (Public Law 109–58) includes transportation-related provisions that reduce reliance on foreign energy sources (mainly petroleum) and increase use of recovered mineral content in federally funded projects involving procurement of cement or concrete.

CTA evaluated potential energy impacts and benefits associated with construction and operation of the RLE Project. Changes related to the project—in travel patterns and mode choice within the regional transportation network—have the potential to result in changes in net energy demand.

Analysis of long-term energy consumption changes included regional transportation-related energy consumption based on VMT and transit operations. As people choose to use improved transit instead of driving automobiles, VMT can be reduced. Transit operations use energy for vehicle propulsion and operation of stations. The baseline energy consumption was determined from the total regional VMT for the No Build Alternative in 2030, as estimated by CMAP's Regional Travel Demand Model (CMAP 2012c). The VMT was converted to British thermal units (BTU) using 3,650 BTU per vehicle mile traveled, a value derived from an estimated achieved fuel economy of 34.5 miles per gallon for cars and light trucks in 2025 from Corporate Average Fuel Economy standards (National Highway Traffic Safety Administration 2012). Either the East or West Option would result in lower regional VMT than with the No Build Alternative, and would thus result in less vehicular energy consumption than the No Build Alternative.

CTA calculated operational energy consumption based on the total additional annual rail car miles and the average kilowatt-hour per revenue car mile provided by CTA. Kilowatt-hours were then converted to BTU. Station energy was calculated based on similar CTA Red Line elevated stations in 2010.

The projected annual transportation-related energy consumption in the region for the No Build Alternative is approximately 368 trillion BTU, based on output from CMAP's Regional Travel Demand Model (CMAP 2012c). The projected regional travel demand for the East and West Options is marginally smaller than for the No Build Alternative; the East or West Option would result in 11.4 to 19.6 million fewer annual VMT than the No Build Alternative. The difference in projected energy use (regional transportation plus transit operations) between the East or West

Option and the No Build Alternative would not be greater than the margin of error for regional modeling.

The East and West Options would require energy for operations. The net difference in energy use for either option would be less than +/- 0.02 percent, which is smaller than the margin of error for regional modeling. The difference in energy use between the East and West Options and the No Build Alternative (368 trillion BTU for regional vehicular travel in 2030) would be negligible. Operation of the East and West Options would not have an impact on regional energy consumption. While the difference in energy use would be negligible, this analysis shows there would be no adverse energy impact associated with the East or West Option.

CTA evaluated construction energy consumption for the East and West Options to determine the short-term impacts of the project on regional energy use. Capital cost estimates were used to determine the construction energy consumption by applying an energy cost factor from *Energy and Transportation Systems* (California Department of Transportation 1983). Energy was expressed using BTU. Energy use includes both manufacture of components and construction to install the components. Energy would be required for construction of either the East or West Option.

Energy would be used for the production of the guideway and station components (including steel, cement, copper, and glass). Energy would also be used for the operation of construction equipment. Energy use by construction equipment would be localized and temporary. Construction energy use for the East and West Options includes construction of elevated structures and stations. The East Option would use approximately 6,130 billion BTU for construction and the West Option would use approximately 6,170 billion BTU for construction.

The one-time irreversible commitment of energy resources for construction would amount to less than 1.2 percent of the total annual energy consumption for Cook County, which is 530 trillion BTU (CNT Energy 2009). Construction of either option would not have an impact on energy consumption in the Chicago Metropolitan Area, Cook County, or the project area.

Because the RLE Project would not have an impact on regional energy consumption, no mitigation measures are proposed. The *Energy Technical Memorandum* (**Appendix W**) contains additional details.

Chapter 7
Environmental Justice

Environmental justice (EJ) is "the fair treatment and meaningful involvement of all people regardless of race, color, national origin, or income with respect to the development, implementation, and enforcement of environmental laws, regulations, and policies" (USEPA 2004). This chapter summarizes the EJ analysis and outreach conducted for this project. The *Environmental Justice Technical Memorandum* (**Appendix X**) provides additional details.

The project area consists entirely of minority communities, some of which are also low-income areas. All of the benefits and impacts of the project would occur within these minority and low-income populations (EJ populations). Few benefits would occur outside of the minority and low-income areas. As such, both the East and West Options would have impacts on EJ populations; however, none of the impacts would be disproportionately high and adverse. FTA and CTA have undertaken outreach and ongoing coordination with affected communities to identify EJ populations, discuss project impacts and benefits, and mitigation measures where relevant.

7.1 Regulatory Framework/Methods

Federal agencies are required to consider the potential for disproportionately high and adverse impacts on EJ populations that could result from all programs, policies, and activities (Executive Order 12898). As described in Executive Order 12898, a disproportionate impact is one that would negatively affect EJ populations to a greater extent than non-EJ populations. In accordance with FTA guidance, including the August 2012 FTA Circular 4703.1 (*Environmental Justice Policy Guidance for Federal Transit Administration Recipients*), the EJ process and analysis for the RLE Project were designed to accomplish the following:

- Avoid, minimize, or mitigate disproportionately high and adverse human health and environmental impacts, including social and economic impacts, on EJ populations.
- Ensure the full and fair participation by all potentially affected communities in the transportation decision-making process.
- Prevent the denial of, reduction in, or significant delay in the receipt of benefits by EJ populations.

CTA performed the EJ analysis in compliance with Executive Order 12898 (1994), USDOT Order 5610.2(a) (2012), and FTA Circular 4703.1 (2012). **Appendix X** contains additional details regarding federal, state, and local EJ regulations.

CTA performed the analysis of the potential for disproportionate impacts on EJ populations using the following steps:

1. Demographic Analysis and Initial Community Outreach
    - CTA used socioeconomic data from the 2010 Census and the American Community Survey to describe the population in the project area. Income, ethnicity, employment, age,

housing characteristics, disability, and English proficiency were used in conjunction with field observations and stakeholder interviews to help identify the presence of EJ populations.

- CTA collected information about elderly and disabled populations in accordance with the laws of the State of Illinois. CTA identified distinct elderly populations using a 50 percent threshold in accordance with the Illinois Environmental Justice Act. Disability statistics were compiled from 2010 Census data and American Community Survey data at the block group level to include individuals with a sensory, physical, or mental disability or other condition that limits activities of daily living. CTA then compared these statistics to citywide averages. Information on elderly and disabled populations was also overlaid onto the federally protected minority and low-income community areas to provide additional information on elderly populations and people with disabilities within the project area.

- **Section 7.2** summarizes the data analysis, and **Appendix X** contains the limited English proficiency (LEP) analysis. The project area consists of predominantly minority populations, with some concentrations of low-income groups. CTA also identified pockets of Spanish-speaking populations, indicating the need for outreach in both English and Spanish languages.

2. Environmental Analysis to Identify Adverse Impacts and Benefits

   - All of the benefits and impacts of the project would accrue to the same EJ populations. The EJ-specific environmental analysis focused on identifying all adverse impacts and mitigation measures of the East and West Options because they would both affect EJ populations.

   - Benefits that would offset the potential impacts were also identified and included in the analysis. Identification of additional mitigation measures specifically for EJ purposes would not be necessary for the RLE Project, because none of the impacts would be disproportionately high and adverse. No additional mitigation measures—beyond those identified in **Chapters 3, 4, 5, and 6** of this Draft EIS—would be needed to meet EJ requirements. **Section 7.4** presents the results of the EJ analysis.

3. Engagement with EJ Populations in the Public Outreach and Decision-Making Process

   - The stakeholder interview process and CTA's ongoing community relations efforts helped identify effective outreach methods. As described in **Chapter 10**, traditional outreach methods such as public meetings and comment periods were augmented by nontraditional outreach. Nontraditional activities included website postings, presentations to local community groups, e-mail and direct mail newsletters, and one-on-one meetings with elected officials and community group leaders. Per the LEP analysis, CTA provided Spanish translation of meeting handouts and Spanish and sign language interpreters at open house meetings. In addition, CTA maintains a project-specific e-mail address to receive comments and requests to receive updates on the project. **Section 7.3** and **Chapter 10** summarize the outreach process.

4. Incorporation of Input from EJ Populations into the NEPA Process

    - After the public meetings held in spring 2014, CTA decided not to pursue the Halsted Alternative in part because of public comments, including comments from EJ populations and community groups, in opposition to that alternative. In addition, the Halsted Alternative failed to fully meet the purpose and need of the project as described in **Section 2.4.3**. After the public meeting, CTA conducted additional engineering analysis to further refine the East and West Options to minimize displacements and impacts on the area parks where possible.

7.2 Existing Conditions

The project area consists entirely of predominantly minority populations (see **Figure 7-1**). Nearly all residential portions of the project area contain over 75 percent African American residents, with many areas approaching 100 percent. The project area contains a higher proportion of minority residents (97.9 percent) than the City of Chicago as a whole (68.3 percent).

The 2010 annual median household income for communities in the project area ranges from approximately $11,000 in Riverdale to $54,000 in the Village of Calumet Park. Project area median income (approximately $41,000) is lower than the City of Chicago as a whole ($46,900) and Cook County ($54,000). Within the project area, the census block groups with the lowest income are concentrated around the Riverdale community area (southeastern portion of the project area) and the Altgeld Gardens public housing project, with some pockets along Michigan Avenue in Roseland and along 119th Street in West Pullman (see **Figure 7-2**). Note: Blocks of white space represent areas with low population density such as schools and industrial areas.

The highest percentages of LEP populations occur in the West Pullman community, east of State Street between 115th and 119th Streets (see **Figure 7-3**). Other areas with LEP residents include Pullman east of the Metra Electric District Line between 111th and 119th Streets, and near Lake Calumet. According to the 2010 U.S. Census, English is the most spoken language at home in the project area, with 92.6 percent of households speaking English only. Spanish is the second most spoken language at home, with over 6 percent of households speaking Spanish. The largest Spanish-speaking populations live in the Village of Calumet Park, where 15.5 percent of households speak Spanish. Pullman and West Pullman also have large percentages of Spanish-speaking households with 10.4 percent and 6.7 percent of homes speaking Spanish, respectively. Specific census tracts in the West Pullman and South Deering community areas and the Village of Calumet Park reported that over 30 percent of households speak Spanish. The full LEP Assessment is included in **Appendix X**.

Note: Blocks of white space represent areas with low population density such as schools and industrial areas.

Figure 7-3: Percentage of Population that has Limited English Proficiency

The entire project area consists of predominantly minority populations (**Figure 7-1**), with some concentrations of low-income groups (**Figure 7-2**). For these reasons, the entire project area is considered an EJ community. The low-income area in Riverdale (the southeastern portion of the project area) has minimal population between 115th and 130th Streets; the majority of the population in this area resides south of 130th Street and is living below the poverty level.

In addition, approximately 15.3 percent of those living within the project area are elderly, which is higher than the citywide elderly proportion of 10.3 percent (U.S. Census Bureau 2010). Disabled populations within the project area constitute 15.4 percent of the project area population, higher than the 11.0 percent found at the citywide level (U.S. Census Bureau 2012). The *Environmental Justice Technical Memorandum* (**Appendix X**) provides further details about elderly and disabled populations.

7.3 Specialized Outreach

Full and fair access to meaningful involvement by EJ populations in project planning and development is an important aspect of EJ (Executive Order 12898). Using demographic data to determine the presence of EJ populations is only the first step in a robust EJ approach. Ensuring full and fair access means actively seeking the input and participation from those typically under-represented groups throughout all project stages. Residents can provide important information on community concerns, special sites, and unusual traffic, pedestrian, or employment patterns in the corridor. This information can be used in the design and evaluation of alternatives, to avoid negative impacts on valued sites, and to support the development of safe, practical, and attractive transportation options that are responsive to the concerns of EJ communities.

CTA has implemented a robust outreach program with an emphasis on meaningful exchange with EJ populations. **Chapter 10** and **Appendix C** provide additional details on public and agency coordination conducted.

Public and community meetings were conducted in compliance with NEPA guidelines and held at locations selected to reflect equitable geographic coverage and proximity to public transportation, and to minimize overlap with other meetings scheduled in the project area. The locations were within the project area, accessible by public transit, and ADA compliant. CTA performed an LEP assessment in 2009 and determined that public outreach materials should be prepared in both English and Spanish. Spanish translation of meeting handouts and Spanish and sign language interpreters were made available at every public meeting. CTA also offered to make translators for additional languages available upon request at the open house meeting.

In September 2009, two public scoping meetings provided the public with an opportunity to comment on the project purpose and need, alternatives considered, and issues and areas of concern to be considered in the Draft EIS. The meetings were publicized via direct mail and e-mail notices using the stakeholder database, postings on CTA's website, display advertisements in multilingual publications (English and Spanish), a legal notice placed in the Chicago Tribune, CTA customer alerts, flyers distributed to key locations along the project corridor, and notices posted in libraries and village halls.

CTA held an open house meeting at St. John Missionary Baptist Church on August 2, 2011 to update the community regarding the RLE Project. The meeting was publicized using the same methods as listed above. The meeting location was chosen because of its central location in the project area and proximity to public transportation, and to minimize overlap with other meetings scheduled in the project area. The location was accessible by public transit and compliant with the ADA. Spanish and sign language interpreters were available at the meeting.

In April and May 2014, CTA again reached out to the general public as well as the identified EJ population and local community groups via a public open house meeting and individual community group meetings. Within the project area, community groups who were identified and contacted as part of the EJ and community group outreach included the following:

- 34th Ward Town Hall
- Agape Community Center
- Chicago Neighborhood Initiatives
- Chicago Park District
- DCP
- Far South Side Community Development Corporation
- Friends of the Parks
- Golden Gate Homeowners Association
- Greater Roseland Chamber of Commerce
- People for Community Recovery
- Roseland Business Development Council
- Roseland Manor
- Rosemoor Community Association
- St. Anthony of Padua Parish

CTA contacted each of the groups by telephone and provided them an opportunity for a presentation on the proposed project.

At the request of interested community groups, CTA conducted meetings to share information about the project and allow community members to ask questions and voice concerns. CTA held 13 community group meetings. **Appendix C** contains meeting notes and other supporting information for the outreach efforts.

The purpose of the spring 2014 outreach was to get public feedback on the alternatives, potential impacts, and mitigation and to give the community an opportunity to ask questions about the project. In addition to the 13 community group meetings, CTA held an open house on May 13, 2014.

Input received at the open house and community meetings affected the RLE Project in several ways, the most significant of which was the elimination of the BRT and Halsted Alternatives from further consideration. The community expressed concern about the BRT Alternative's failure to meet the purpose and need.

CTA has considered the EJ communities' comments and concerns in the crafting of mitigation measures to reduce adverse impacts. These mitigation measures are described in greater detail in the environmental consequences analysis.

In addition, CTA has been mindful to promote full and fair participation from all members of the public during the decision-making process for the RLE Project. CTA's public meetings on the RLE Project are held in the evening so that the largest number of community members can attend. CTA's efforts include specialized outreach to people who, as a result of national origin, have LEP. CTA evaluated the need for additional outreach by using 2010 Census data and analyzing whether populations throughout the project corridor were linguistically isolated because of challenges with reading, writing, and/or speaking English. The largest Spanish-speaking populations live in the Village of Calumet Park, where 15.5 percent of households speak Spanish. Pullman and West Pullman also have a large percentage of Spanish-speaking households with 10.4 percent and 6.7 percent of homes speaking Spanish, respectively. Specific census tracts in the West Pullman and South Deering community areas and the Village of Calumet Park reported that over 30 percent of households speak Spanish.

Based on CTA's analysis, Spanish language interpreters were made available at all public meetings. Interpreters for other languages were also made available upon request at all public open houses, community meetings, and the public hearing for the project. Sign language interpreters were also made available at all public meetings.

7.4 Environmental Consequences

FTA Circular 4703.1 indicates that projects in areas consisting entirely of EJ populations do not necessarily eliminate the possibility of disproportionately high and adverse impact findings; however, the following characteristics are true of the project area and East and West Options:

- The entire project area is predominantly minority populations. No community in the project area contains less than 92.9 percent minority populations, and the project area as a whole contains 97.9 percent minority populations.

- All of the impacts and benefits of the East and West Options would accrue to the same minority populations.

- The purpose of this community-initiated project includes connecting disadvantaged communities to Chicago's major employment and activity centers in an effort to spur economic development and improve livability. The project would help remediate the geographic isolation and lack of employment and development opportunities that currently exist in the project area.

A multistep process was used to assess the potential for disproportionately high and adverse impacts on EJ populations as described in **Section 7.1**. Categories that had adverse impacts remaining after mitigation were analyzed further to determine whether any of those impacts would be disproportionately high or adverse. An impact would be disproportionately high or adverse if the effect (1) would be predominantly borne by an EJ population, or (2) would be suffered by the EJ population and would be appreciably more severe or greater in magnitude than the adverse effect suffered by the non-EJ population. Project benefits to EJ communities were also considered.

To provide a complete picture of how the RLE Project would affect EJ populations, this section summarizes the benefits and adverse impacts that would occur in EJ communities and the associated mitigation measures:

- **Beneficial Impacts of the Project** - To estimate the extent of the benefits derived from the East and West Options, the analysis in **Table 7-1** provides a comparison of the benefits with regard to the following criteria:
  - Reduced Transit Times
  - Increased Travel Choices
  - Increased Economic Competitiveness
  - Environmental Criteria
- **Resources with Limited or No Adverse Impacts** - The East and West Options would have limited or no adverse impacts in these environmental resource categories (**Chapter 6**). Because there would be no adverse impacts, there is no potential for disproportionately high and adverse impacts and these categories will not be carried forward for further analysis.
  - Air Quality
  - Water Quality
  - Floodplains
  - Vegetation and Wildlife Habitat
  - Threatened and Endangered Species
  - Geology and Soils
  - Energy
- **Resources with No Adverse Impacts after Mitigation** - The East and West Options would have adverse impacts that would not remain adverse after mitigation in the following categories. Because there would be no adverse impacts after mitigation, there is no potential for disproportionately high and adverse impacts and these categories will not be carried forward for further analysis. Further details about these impacts and the proposed mitigation measures are provided in **Chapter 4**.
  - Land Use and Economic Development
  - Displacement and Relocation of Existing Uses
  - Noise and Vibration
  - Safety and Security
  - Historic and Cultural Resources
  - Hazardous Materials
  - Wetlands

- **Resources with Adverse Impacts after Mitigation** - As shown in **Table 7-2**, adverse impacts would remain after mitigation for both the East and West Options in two categories. These adverse effects would not be fully addressed through mitigation measures, resulting in unavoidable adverse effects. Categories with potential adverse effects after mitigation are considered for their potential for disproportionately high and adverse effects on EJ communities. They are discussed in more detail in **Sections 7.4.2** and **7.4.3**.
    - Neighborhoods and Communities - Permanent Impacts
    - Visual and Aesthetic Conditions - Permanent Impacts

Table 7-1: Summary of Benefits

Benefits and Resource Areas	No Build Alternative	Union Pacific Railroad Alternative East Option	Union Pacific Railroad Alternative West Option
Reduced Transit Times	No	Yes	Yes
Travel Times Between Stations:[1] 130th to 95th 130th to Jackson	 28 minutes 58 minutes	 14 minutes 39 minutes	 14 minutes 39 minutes
Increased Travel Choices	No	Yes	Yes
Increased Economic Competitiveness	No	Yes	Yes
Land Use and Economic Development	No Impacts	Economic development benefits resulting from the enhanced transit service	Economic development benefits resulting from the enhanced transit service
Neighborhoods and Communities	No Impacts	Improved mobility, access to parklands and community facilities, access to jobs, possible economic development, community revitalization, new space for community facilities and retail, and direct service to Altgeld Gardens	Improved mobility, access to parklands and community facilities, access to jobs, possible economic development, community revitalization, new space for community facilities and retail, and direct service to Altgeld Gardens
Hazardous Materials	No Impacts	Cleanup and/or removal of contaminated material during construction	Cleanup and/or removal of contaminated material during construction
Transportation	No Impacts	Public transportation would benefit from expanded rail transit service and rerouted bus service within the project area. Pedestrians would benefit from upgraded intersections immediately adjacent to the stations with ADA-accessible curb ramps and replacement of deteriorated sidewalks.	Public transportation would benefit from expanded rail transit service and rerouted bus service within the project area. Threatened and Endangered Species	--	--	--	No
Geology and Soils	--	--	--	No
Energy	--	--	--	No
Cumulative	--	--	--	No

-- = No disproportionate adverse effect before mitigation (no mitigation required).

[1] Unless noted separately, impacts are stated for both permanent and construction.

7.4.1 No Build Alternative

The No Build Alternative would not involve any new construction for the RLE Project, and would not have any adverse impacts. No mitigation measures would be required. The No Build Alternative would, however, lack the transportation benefits that the East or West Option would provide, such as reduced travel times, better access to jobs, and economic development. The No Build Alternative would also fail to address the community's desire for growth initiatives that could attract new economic development interests to the area. In addition, potential remediation benefits associated with the UPRR Alternative would not occur with the No Build Alternative.

7.4.2 Union Pacific Railroad Alternative - East Option

The UPRR Alternative East Option would involve an extension of the Red Line from its current endpoint at the 95th Street Terminal southward to 130th Street in the vicinity of Altgeld Gardens via existing highway rights-of-way and railroad corridors. The new rail service would improve commute times to jobs, provide better transit access to geographically isolated communities, and potentially spur economic development in surrounding neighborhoods. The East Option would have permanent adverse impacts on neighborhoods and communities as well as visual and aesthetic conditions. The adverse impacts would occur in the project area, which consists entirely of EJ communities.

Neighborhoods and Community Impacts

The East Option would have permanent adverse impacts on community character and cohesion that could not be mitigated due to the visual encroachment of the elevated structure into the neighborhood north of I-57 in Roseland and at 117th Street and Prairie Avenue in West Pullman. Mitigation measures for impacts on community character, including planting additional landscaping, would not be sufficient to offset this permanent impact. The East Option alignment would pass through the northwestern corner of Wendell Smith Park and the western portion of Block Park, would displace Now Faith Church of God Holiness, and would displace part of the schoolyard at Kwame Nkrumah Academy. The church could be relocated within the neighborhood. The East Option would largely leave the functional and recreational use of the parks intact and impacts would not be adverse after mitigation. See **Section 4.3** for additional details on mitigation measures for permanent neighborhood and community impacts.

By improving travel time, operation of the East Option would improve access to parklands and community facilities within walking distance (½ mile) of the station locations. The East Option would substantially reduce travel times between neighborhoods in the project area, and would enhance their connection with major job and activity centers to the north. The new transit service and the subsequent increase in pedestrian traffic could attract new businesses to the area and support the growth and enhancement of these neighborhood retail and service nodes. The parking garage at the Michigan Avenue station would provide space for retail and community facilities. The station would serve as a transit hub that brings additional passengers and visitors to the area, which could further boost economic development. The result would be an overall increase in community livability. The mobility and development impacts of the East Option would be beneficial.

Visual and Aesthetic Conditions

The elevated structure would cause adverse visual impacts north of I-57 and at 117th Street and Prairie Avenue, as discussed in **Section 4.4**. Mitigation measures would reduce the impacts at these locations, but due to the proximity of the elevated structure to residential areas, the impacts would remain adverse despite mitigation. Mitigation measures to reduce visual impacts would include landscaping, using urban design techniques to reduce massing, and creating pedestrian-friendly surroundings.

Conclusion

Considering the impacts, mitigation measures, and benefits, the East Option's permanent impact on community character and permanent visual impact would not be appreciably more severe or greater in magnitude than similar effects elsewhere in CTA's rail system. The mitigation measures proposed are similar in nature to those for other CTA projects and have been proposed by CTA, with input from local communities, consistently in EJ and non-EJ communities alike. The project offers substantial benefits that would accrue to the resident EJ populations. Although the East Option would still have adverse impacts on EJ communities, these impacts would not be disproportionately high or adverse. As such, no EJ-specific mitigation measures beyond those identified in **Chapter 4** would be required.

7.4.3 Union Pacific Railroad Alternative - West Option

Like the UPRR Alternative East Option, the West Option would involve an extension of the Red Line from its current endpoint at the 95th Street Terminal southward to 130th Street in the vicinity of Altgeld Gardens via existing highway rights-of-way and railroad corridors. The new rail service would improve commute times to jobs, provide better transit access to geographically isolated communities, and potentially spur economic development in surrounding neighborhoods. The West Option would have permanent adverse impacts on neighborhoods and communities as well as visual and aesthetic conditions. The adverse impacts would occur in the project area, which consists entirely of EJ communities.

Neighborhoods and Communities

The West Option would have permanent adverse impacts on community character and cohesion that could not be mitigated due to the visual encroachment of the elevated structure into the neighborhood north of I-57 and between 99th and 103rd Streets in Washington Heights. The 103rd Street station in Roseland and Washington Heights and the Michigan Avenue station park & ride facility in West Pullman would also cause adverse visual impacts because they would change the scale, density, and character of the local community. Mitigation measures for impacts on community character, including planting additional landscaping, would not be sufficient to offset these permanent impacts. The West Option alignment would pass through Fernwood Parkway, and would displace the Grace Temple Church of God Established in Christ. The church could be relocated within the neighborhood; however, as of July 2015 the building is vacant. CTA would keep the area beneath the track structure in Fernwood Parkway open for use, and improve park space elsewhere in the neighborhood. See **Section 4.3** for additional details on mitigation measures for permanent neighborhood and community impacts.

Other impacts, benefits, and mitigation measures would be similar to those for the East Option, as discussed above in **Section 7.4.2**.

Visual and Aesthetic Conditions

The elevated structure would cause adverse visual impacts north of I-57, between 99th Street and 103rd Street, near the 103rd Street station, and near the Michigan Avenue station park & ride facility, as discussed in **Section 4.4**. Mitigation measures to reduce visual impacts would include providing landscaping and replanting vegetation where possible, designing the station and park & ride facility to match the character of the surrounding neighborhood, using urban design techniques to reduce massing, and creating pedestrian-friendly surroundings. Exterior lighting would be shielded and carefully placed when adjacent to sensitive areas such as residential communities. The impacts would remain adverse after mitigation.

Conclusion

Considering the impacts, mitigation measures, and benefits, the West Option's permanent impact on community character and permanent visual impact would not be appreciably more severe or greater in magnitude than similar effects elsewhere in CTA's rail system. The mitigation measures proposed are similar in nature to those for other CTA projects and have been proposed by CTA consistently in EJ and non-EJ communities alike. The project offers substantial benefits that would accrue to the resident EJ populations. Although the West Option would still have adverse impacts on EJ communities, these impacts would not be disproportionately high or adverse. As such, no EJ-specific mitigation measures beyond those identified in **Chapter 4** would be required.

Chapter 8
Section 4(f) Evaluation

Section 4(f) of the USDOT Act of 1966 is a federal law that established requirements for USDOT (including FTA) consideration of publicly owned parks/recreational areas that are accessible to the general public, publicly owned wildlife/waterfowl refuges, and publicly or privately owned historic sites of federal, state, or local significance in developing transportation projects. This law, commonly known as Section 4(f), is now codified in 49 USC § 303 and 23 USC § 138, and is implemented by FTA through the regulation 23 CFR § 774. Additional guidance on the implementation of Section 4(f) may be found in FHWA's *Section 4(f) Policy Paper* (USDOT, FHWA 2012). FTA has formally adopted this guidance and this analysis was conducted consistent with this guidance.

Publically owned park or recreation land would be used as a result of the options evaluated in the Draft EIS and is further evaluated in this Section 4(f) chapter. Based on the evaluation in this Draft EIS, no historic properties would be affected or used by the project alternatives and further Section 4(f) evaluation of historic properties is not required. Historic properties are described within this chapter to provide sufficient documentation that there is no Section 4(f) use of these properties. This chapter summarizes the findings of the *Parklands and Community Facilities Technical Memorandum* (**Appendix M**), the *Historic and Cultural Resources Technical Memorandum* (**Appendix Q**), and the *Park Replacement Analysis Technical Memorandum* (**Appendix Y**).

As part of the public hearing for this Draft EIS, the public will be offered the opportunity to comment on FTA's preliminary determinations in this Section 4(f) analysis and on the mitigation measures identified, including potential replacement park options. After the public comment period is complete, FTA will make a final Section 4(f) determination based on information in this chapter, the referenced technical memoranda, further coordination with the Chicago Park District, and public comments received. FTA's Section 4(f) determination will either (1) confirm the preliminary findings within this Draft EIS for inclusion in the Final EIS and ROD for the project, or (2) require additional Section 4(f) analysis, which will be prepared as part of the Final EIS.

8.1 Project Description and Supporting Information

CTA, as project sponsor to FTA, proposes to extend the existing Red Line HRT service 5.3 miles south from the existing 95th Street Terminal to 130th Street on Chicago's Far South Side. The project area is 11 miles south of the Loop. The project would address the following needs:

- Transit trips to jobs are longer for Far South Side residents than they are for residents in the Chicago seven-county region as a whole.
- Transit-dependent populations in the project area have limited direct access to rapid transit rail service.

- The project area is geographically isolated from major activity centers and provides residents limited viable transportation options, limiting access between affordable housing (e.g., Altgeld Gardens public housing project) and employment centers outside of the project area.
- Existing transit markets are underserved and transit connectivity is challenging in the project area.
- Disinvestment and limited economic development in the project area have negatively affected Far South Side communities.
- The existing 98th Street Yard does not have capacity to store rail cars for any substantial increase in Red Line capacity accompanying future Red Line expansion.

Additional details on the purpose and need for the project are in **Chapter 1**. The Chicago Transit Board designated the UPRR Alternative, discussed further in **Chapter 2** of the Draft EIS, as the LPA on August 12, 2009.

The UPRR Alternative alignment would run south along I-94 from the 95th Street Terminal, then curve west along the north side of I-57 (within the I-57 right-of-way) for nearly ½ mile until reaching the UPRR corridor in the vicinity of Eggleston Avenue. The alignment would turn south to follow the UPRR corridor. Two UPRR Alternative options for the segment of the proposed alignment between I-57 and the CN/ME tracks near 119th Street are being analyzed:

- East Option - The CTA elevated structure would be placed immediately adjacent to the east side of the UPRR right-of-way.
- West Option - The CTA elevated structure would be placed immediately adjacent to the west side of the UPRR right-of-way.

The alignment would follow the UPRR corridor to Prairie Avenue, where it would cross over the CN/ME tracks near 119th Street. South of this point, the East and West Options would follow the same alignment southeast along the NICTD/CSS & SBRR right-of-way using a portion of the Norfolk Southern Railway and Conrail right-of-way to the terminus (end) of the RLE at 130th Street.

Chapter 2 provides further details on the AA process leading to the development and selection of the LPA and these alignment options.

8.2 Regulatory Framework

This section describes regulatory framework and requirements under Section 4(f) of the USDOT Act of 1966, as amended by 23 USC § 138 and 49 USC § 303, and its implementing regulations and guidance. It includes information on the definition of "use" under Section 4(f) (**Section 8.2.1**) and the basis of making Section 4(f) determinations (**Section 8.2.2**).

8.2.1 Section 4(f) "Use" Determinations

To determine whether Section 4(f) applies to the proposed project and as defined in 23 CFR § 774.17, the protected Section 4(f) properties must be assessed to determine whether there would be a “use” of the property as defined in the statute. Per the regulation, use of a protected Section 4(f) property occurs when any of the following conditions are met:

1. **Permanent Incorporation/Direct Use** - A permanent incorporation or direct use of a Section 4(f) property occurs when land is permanently incorporated into a transportation facility. *“Permanent incorporation”* of a Section 4(f) property would include purchasing part or all of the property for use as right-of-way or for transportation facilities, or purchasing a permanent easement for construction or operations. Even small partial acquisitions of Section 4(f) lands are considered permanent incorporation.

2. **Temporary Use** - A temporary use of a Section 4(f) property occurs when there is a short-term use of the property that is considered adverse in terms of the preservation purpose of the Section 4(f) statute. Under 23 CFR § 774.13, a temporary occupancy of a property does not constitute a “use” of a Section 4(f) property when all of the following conditions are satisfied:

    - The duration is temporary (i.e., less than the time needed for construction of the project), and there is no change in ownership of land.

    - The scope of work is minor (i.e., both the nature and magnitude of the changes to a Section 4(f) property are minimal).

    - There are no anticipated permanent adverse physical impacts, nor is there interference with the protected activities, features, or attributes of the property, on either a temporary or permanent basis.

    - The land being used is fully restored to a condition that is at least as good as that which existed before the project.

    - There is documented agreement among appropriate federal, state, and local official(s) with jurisdiction over the Section 4(f) property regarding the above conditions.

3. **Constructive Use** - A constructive use of a Section 4(f) property occurs when a transportation project would not incorporate land from the property, but the proximity of the project would result in impacts so severe that the protected activities, features, or attributes that qualify the property for protection under Section 4(f) would be substantially impaired (23 CFR § 774.15).

8.2.2 Section 4(f) Approval Options

FTA may not approve the use of a Section 4(f) property, unless it determines the following, as defined in 23 CFR § 774.17:

- There is no feasible and prudent alternative to the use of that land and the project includes all possible planning to minimize harm of using the property.

  OR

- FTA determines that Section 4(f) use of the property would have a “*de minimis*” impact.

Feasible and prudent standards for evaluating avoidance alternatives to using Section 4(f) property are defined in 23 CFR § 774.17. If it is ultimately determined no feasible and prudent avoidance alternative exists, then the alternative with the least overall harm to Section 4(f) properties must be selected. Seven factors, which are established in 23 CFR § 774.3(c)(1), are used in making a determination of the alternative with least overall harm to Section 4(f) properties.

Alternatively, the requirements of Section 4(f) are satisfied with respect to a Section 4(f) property if it is determined by FTA that a transportation project would have a "*de minimis*" impact on the Section 4(f) property.

A *de minimis* impact is defined in 23 CFR § 774.17 as follows:

- For parks, recreation areas, and wildlife/waterfowl refuges, a *de minimis* impact is one that would not adversely affect the features, attributes, or activities qualifying the property for protection under Section 4(f), and the official with jurisdiction has concurred with this determination after there has been a chance for public review and comment.

- For historic sites, a *de minimis* impact means that FTA has determined, in accordance with 36 CFR § 800, that either no historic property would be affected by the project, or the project would have "no adverse effect" on the property in question. The official with jurisdiction must be notified that FTA intends to make a *de minimis* finding based on their concurrence with the "no adverse effect" determination under 36 CFR § 800. This is usually done in the effect determination letter sent to the official with jurisdiction for their concurrence.

If an alternative is found to use Section 4(f) properties, a *de minimis* finding can be made for direct uses or temporary uses that do not adversely affect the activities, features, or attributes that make the property eligible for Section 4(f) protection. The provision allows avoidance, minimization, mitigation, and enhancement measures to be considered in making the *de minimis* determination.

Projects determined to have *de minimis* impacts on Section 4(f) properties may proceed without needing to make a determination that no feasible and prudent avoidance alternatives exist. The officials with jurisdiction must concur in writing with a *de minimis* finding. For parks, recreational areas or wildlife or waterfowl refuge properties, concurrence from the officials having jurisdiction over the properties is required. For historic sites, concurrence from the SHPO on FTA's "No Adverse Effect" determination is required.

8.3 Organization of this Chapter

The sections within this Section 4(f) chapter consider potential impacts in accordance with all applicable regulations and guidance referenced in the previous chapters, and sections are organized to follow the major analysis processes outlined in FHWA's *Section 4(f) Policy Paper*. Each section provides appropriate citations, definitions, and evaluation criteria for each of these steps.

Section 8.4 provides documentation on the identification of all properties potentially afforded protection under Section 4(f). This section includes summary information to identify potential impacts on historic properties, archaeological resources, public parks, recreational facilities, or wildlife/waterfowl refuges.

Sections 8.5 and **8.6** provide the Section 4(f) evaluations for each alignment option proposed. For each Section 4(f) property that was identified, subsections include the following:

- A full description of the Section 4(f) property, including significance for parks identified
- Assessment and determination of Section 4(f) use for that property
- All possible planning to minimize harm, including proposed mitigation measures
- Agency coordination and consultation conducted, including views of the official with jurisdiction over the Section 4(f) property
- A preliminary Section 4(f) finding for the Section 4(f) property

Section 8.7 provides next steps to confirm the preliminary Section 4(f) findings in this chapter.

8.4 Identification of Section 4(f) Properties

The identification of Section 4(f) properties and analyses of use of Section 4(f) properties is based on the findings of the historic and cultural resources analysis (**Section 4.7**, which addresses historic properties), and the neighborhood and community impacts analysis (**Section 4.3**, which addresses parks). The evaluation of properties was also informed by the 2012 *Federal Highway Administration Section 4(f) Policy Paper* issued by FHWA and formally adopted by FTA. Worst-case scenario impacts were assumed throughout the environmental analysis for full disclosure of all potential impacts and identification of potential Section 4(f) uses. Conclusions will be confirmed as part of the Final EIS based on any additional project design decisions that might be made in development of the project, such as station and structure designs beyond conceptual engineering, and after public input on the Draft EIS.

8.4.1 Historic and Archaeological Resources

CTA has been undertaking the Section 106 consultation process since August 2012, as described in **Section 4.7.2**. CTA met with consulting parties in January 2013 to discuss NRHP-eligible properties. As a result of the field investigations and comments received from consulting parties on potentially eligible resources, 15 total resources were identified as eligible for inclusion on the NRHP, including 13 individual buildings and 2 historic districts. On May 8, 2014, FTA and CTA met with consulting parties to discuss potential project effects on NRHP-eligible historic properties. A Draft Effects Report was mailed to consulting parties on April 18, 2014 and responses to comments were provided to consulting parties on November 23, 2016. As described in **Section 4.7.4**, no adverse effects on historic resources would occur because of the RLE Project (East or West Option); no mitigation measures would be required and therefore consultation with consulting parties is complete. In correspondence to the SHPO dated September 21, 2016, FTA made the determination that the UPRR Alternative (East and West Options) would result in no adverse effects. Coordination with the SHPO related to concurrence with FTA's eligibility and effects determinations is ongoing and will continue through the remainder of the project.

Appendix Q contains a full summary of the meeting, comments received, and responses to the comments for the Section 106 consultation.

For historic properties, all properties within the APE that were found to be listed on the NRHP or eligible for listing were identified for further evaluation of potential Section 4(f) use. **Table 8-1** lists the historic properties identified within the APE and summarizes determinations of Section 4(f) use for each alignment option. **Figure 8-1** shows the locations of these historic properties.

Table 8-1: Historic Properties Evaluated for Section 4(f) Use

Address	Property Description	Community Area	Section 4(f) Use	
			Union Pacific Railroad Alternative East Option	Union Pacific Railroad Alternative West Option
444 W. 100th Place	Eclectic Neo-Traditional Home (built 1930)	Washington Heights	No Use	No Use
324 W. 104th Street	Fire Department Engine Co. 93 (built 1917)	Roseland	No Use	No Use
351 W. 104th Street	Roseland Pumping Station (built 1911)	Roseland	No Use	No Use
10920 S. Princeton Avenue	Romanesque Revival-Style Church (built 1916)	Roseland	No Use	No Use
11321 S. Wentworth Avenue	Roseland Community Hospital Nurses Home (built 1930s)	Roseland	No Use	No Use
133-139 E. Kensington Avenue	Former Venetian Hall (built 1925)	Riverdale	No Use	No Use
Multiple (Public Housing Project)	Altgeld Gardens Historic District (built 1945)	Riverdale	No Use	No Use

There would be no permanent incorporation, temporary use, or a constructive use of any of the historic properties under either option. No historic properties or land would be acquired or used for construction or permanently for either alignment option. As such, neither option would result in the use of any historic properties protected under Section 4(f).

There are no known archaeological sites within the project APE. There would be no permanent incorporation, temporary use, or constructive use of any archaeological resources under either option; therefore, neither option would result in the use of any archaeological resources protected under Section 4(f).

8.4.2 Parks, Recreation, and Wildlife/Waterfowl Refuge Resources

No wildlife or waterfowl refuges were identified within ½ mile of the proposed alignment options. There would be no permanent incorporation, temporary use, or a constructive use of any wildlife/waterfowl resources under either option; therefore, neither option would result in the use of any wildlife/waterfowl refuges protected under Section 4(f).

All public parks and recreational properties within 500 feet of the proposed right-of-way area and within ½ mile of the proposed station locations were analyzed for further evaluation of potential Section 4(f) use. **Table 8-2** lists the parks adjacent to the project and determinations of Section 4(f) use for each alignment option. **Figure 8-2** shows the locations of these parks.

There would be no Section 4(f) use of Robert Abbot Park, Kensington Park, Beaubien Woods Forest Preserve, or George Washington Carver Park permanently or during construction. While these parks would be exposed to increased noise during construction or operations, each of these parks is currently located near an existing highway, freight rail line, or major city streets. As such, these parks are not currently quiet, thus, quiet is not essential to their attributes, features, or activities. In addition, noise barriers would mitigate noise impacts near Robert Abbot Park and Kensington Park. Any increased noise would therefore not substantially impair the attributes, features, or activities that render the parks eligible for Section 4(f) protection. In addition, most parks in the project area would benefit from the transit extension due to improved public accessibility.

Parks subject to further evaluation under Section 4(f) include Wendell Smith Park, Fernwood Parkway, and Block Park. **Sections 8.5** and **8.6** of this chapter provide further details on the determination of Section 4(f) uses of these properties and preliminary findings.

8.5 Union Pacific Railroad Alternative East Option Section 4(f) Evaluation

Two Section 4(f) park properties would be used as result of this alignment option: Wendell Smith Park and Block Park, which are evaluated below.

8.5.1 Wendell Smith Park

Description and Significance of Property

Wendell Smith Park is approximately 4.7 acres (340 feet wide by 610 feet long) and is an actively used recreational facility with basketball courts, baseball fields, a play lot, recreation building, and 0.3 mile of walking trails in Roseland. Regularly scheduled activities at Wendell Smith Park include basketball tournaments, baseball/softball games, and concerts. The park is also actively used by day camps and for activities organized by the Chicago Park District. **Figure 8-3** through **Figure 8-5** are photos and an aerial view of Wendell Smith Park.

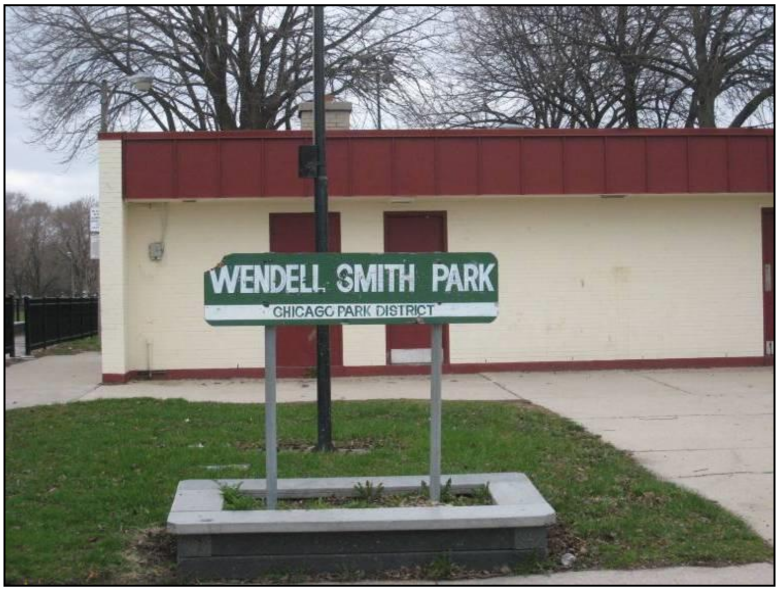

Figure 8-3: Photo of Entrance to Wendell Smith Park Facing West from Princeton Avenue

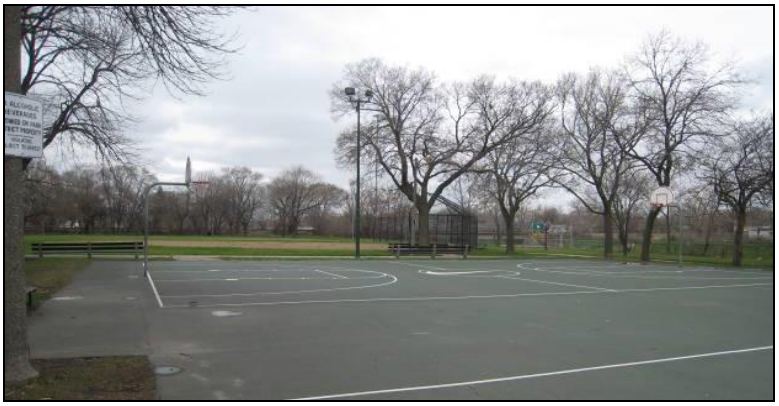

Figure 8-4: Photo of Wendell Smith Park Basketball Courts Facing West

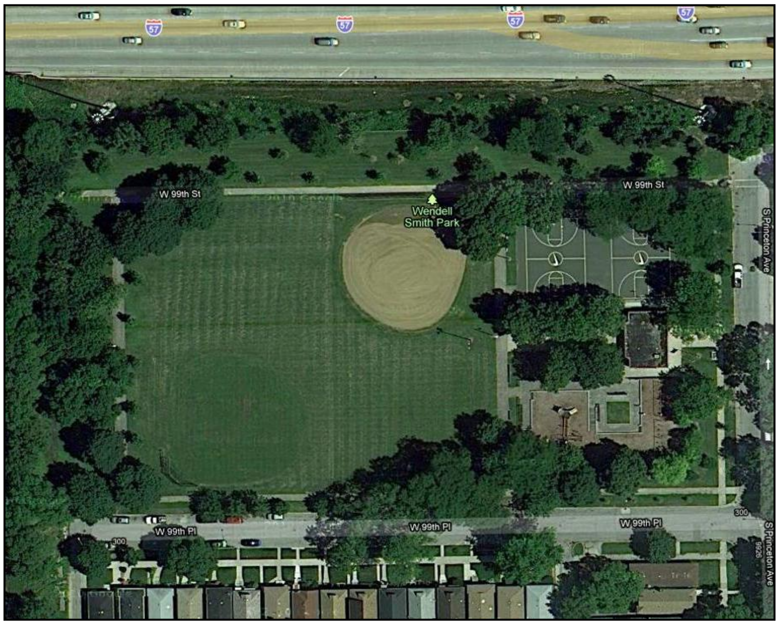

Source: Google Maps 2011

Figure 8-5: Aerial Photograph of Wendell Smith Park

Section 4(f) Use Assessment

The East Option alignment would run through the northwestern corner of the park, as shown in **Figure 8-6**. Elevated track structure supports would be placed permanently in the park space. Of the 4.7 acres of the park, approximately 0.7 acre would be overlapped by the elevated structure and its associated clearances. Piers would be located in the park, and the bottom of the elevated structure would be approximately 15 feet above ground level.

The following attributes and features of the park are within or adjacent to the overlap area:

- **Paved Walking Path/Trees/Bench** - An existing paved walking path is maintained along the entire rectangular perimeter of the park. The westernmost north-south portion of the walking trail and a small portion of the northwestern edge of the walking path would be overlapped by the track structure. A number of small trees line the existing walking path and would be used by the overlap with tracks. In addition, there are two benches along the westernmost north-south walking path within the overlap area.

- **Baseball Field** - There are two baseball fields within Wendell Smith Park. The sand-filled baseball field on the northeast portion of the park is a junior-size baseball diamond. A small portion of the existing outfield/open space would be within the overlap area, but the overlap would not affect the ability to use the baseball field. The second baseball field is a smaller, junior-sized baseball field in the southwest corner of the park. This junior baseball field contains a backstop and bench. Due to the proposed overlap area, the bench and space behind this backstop would be used.

The overlap of the elevated track and placement of elevated track structure supports within the park would limit park use in the overlapped area. This limitation on land owned or operated by the Chicago Park District (because of the elevated structure being placed on its property) is referred to as a permanent easement. Because a permanent easement is proposed, the land within the easement would be considered a permanent incorporation (direct use) of the park facilities. The park would remain active during construction, with the exception of the overlapped portion of the park, and construction would not result in substantial changes to the park. There would be temporary and permanent uses of the protected attributes, features, and activities of the park due to the overlapped portion of the park needed for permanent right-of-way. There would be no noise impacts related to operation of the proposed project after construction of mitigation measures (noise barrier). Mitigation measures, further discussed below, would be implemented in advance of construction to the extent possible to maintain all park facilities. Remaining land used (area not used for the structure) would be restored to a condition at least as good as that which existed before the project.

Figure 8-6: Impacts on Wendell Smith Park - Union Pacific Railroad Alternative East Option

All Possible Planning to Minimize Harm

Wendell Smith Park would continue to serve the surrounding community after implementation of the project. The following mitigation and enhancement measures are proposed so that there would be no adverse impacts on the features, attributes, and activities of the park as a result of the project. CTA coordinated with the Chicago Park District as part of the preparation of the Draft EIS to further develop mitigation measures and conceptual plans. **Appendix Y** provides conceptual plans for replacement of amenities within Wendell Smith Park and other replacement park options.

- Replacement of lands (acreage) used with lands of reasonably equivalent usefulness and location and of at least comparable value. The replacement land would be used to construct new park space in or near the Roseland community area to enhance parkland availability for the surrounding community. New park area created through this replacement acreage would be constructed in accordance with Chicago Park District standards and would facilitate Chicago Park District master planning goals and objectives.

- Replacement of the two smaller, junior-sized baseball fields within Wendell Smith Park to provide one larger baseball field. This mitigation measure was developed based on coordination with the Chicago Park District so that the attributes, features, and activities within the park would not be adversely affected as a result of the East Option. This measure would enhance existing baseball facilities and activities within the park. Additional outreach to the public will be conducted to share concepts and obtain public feedback.

- Relocation and replacement of the smaller, junior-sized baseball field on replacement parkland based on coordination with the Chicago Park District and outreach to the public so that the attributes, features, and activities would not be adversely affected by the use of the northwest corner of the park.

- Replacement and relocation of facilities affected by the project including sidewalks, paths, benches, trees, and other facilities within Wendell Smith Park.

- Restoration and landscaping of disturbed areas.

- Incorporation of design features where necessary to reduce or minimize impacts of use on the Section 4(f) property. Such features would be designed in a manner that would enhance the park but not adversely affect the safety of the transit facility.

Preliminary Section 4(f) Finding

Based on consideration of the proposed direct use as well as the proposed mitigation and enhancement measures, no adverse impacts on the attributes, features, or activities would result from the East Option; therefore, a *de minimis* finding is proposed for this Section 4(f) use. The Chicago Park District has concurred with this No Adverse Effect determination with the commitment of proposed mitigation measures in its letter dated August 17, 2015 (see **Appendix C**).

A public involvement process will be held in conjunction with the required NEPA public involvement process after publication of the Draft EIS for review and comment on this preliminary finding. During development of this Draft EIS, CTA and the Chicago Park District coordinated on several potential locations for new/replacement park space and replacement of amenities within Wendell Smith Park. **Appendix Y** provides conceptual plans for potential replacement parks based on this coordination. These locations and conceptual plans will be shared with the public for input as part of the Draft EIS public hearing.

FTA will consider public comment and the availability of the replacement park in determining whether the preliminary *de minimis* impact determination within this Draft EIS is appropriate. Based on FTA's finding and public input, a preferred location for replacement parkland will be identified as part of the Final EIS. The final location of the replacement park will be confirmed and secured based on ability to acquire property voluntarily, following the completion of the environmental phase of this project.

Agency Coordination and Consultation

Coordination with the agency with jurisdiction over the property, the Chicago Park District, is ongoing and will continue through development of the Final EIS. Early coordination meetings were held on April 18, 2011; July 23, 2013; May 8, 2014; and April 8, 2015 to provide Chicago Park District staff with information on the purpose and need for the project, identification and refinement of alternatives, and potential impacts on parks, and to discuss proposed mitigation measures. The Chicago Park District provided its concurrence on August 17, 2015 that after implementation of the proposed mitigation measures there would be no adverse impact on parks from either alignment option. Additional coordination meetings were held to further develop and refine proposed mitigation measures on October 8, 2015; March 10, 2016; April 6, 2016; May 18, 2016; and June 15, 2016. This coordination will continue as public input is obtained and when finalizing replacement park options and other mitigation measures in the Final EIS. The Chicago Park District has indicated that it regards this project as an opportunity to expand and enhance park activities and overall connectivity in the community once mitigation measures are in place.

8.5.2 Block Park

Description and Significance of Property

Block Park is a passive green space and is divided into two parcels by Harvard Avenue in Roseland. The east parcel is approximately 1.4 acres (130 feet wide by 460 feet long) and includes amenities such as benches, walking paths, and sidewalks. The west parcel is approximately 1.3 acres (90 feet wide by 600 feet long) and is open space with a sidewalk and no other park amenities. In addition, a communications tower and two utility structures are on the west parcel. **Figure 8-7** and **Figure 8-8** are photos of Block Park.

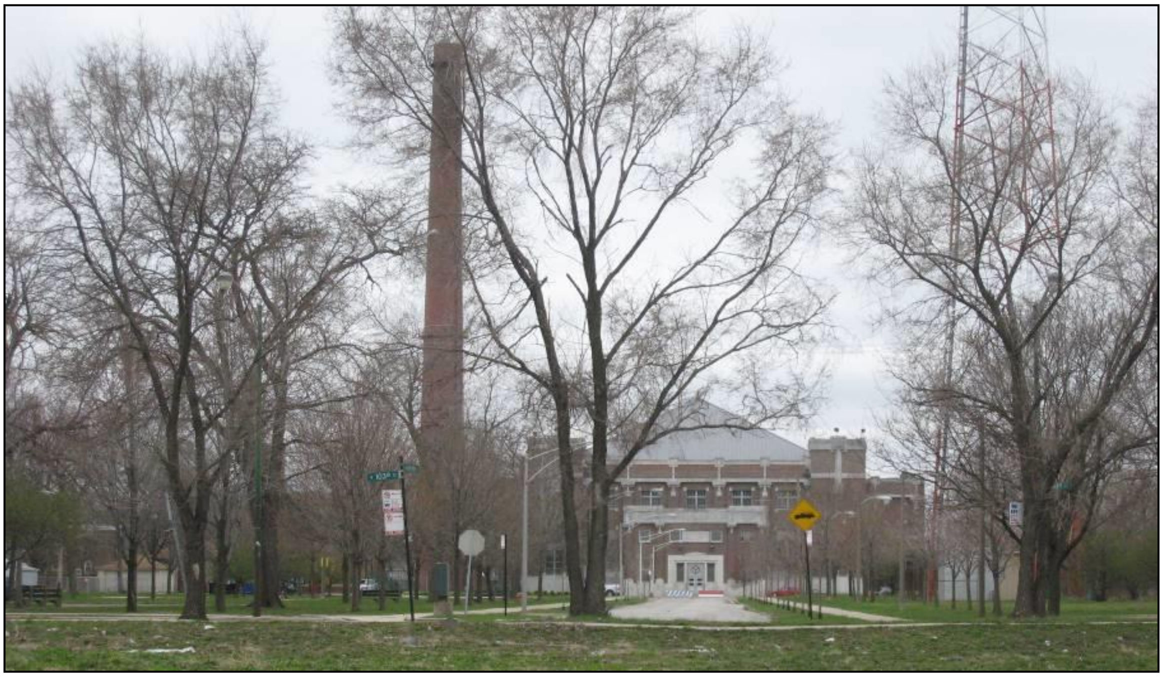

Figure 8-7: Photo of Block Park with the Roseland Pumping Station in the Background (Facing South)

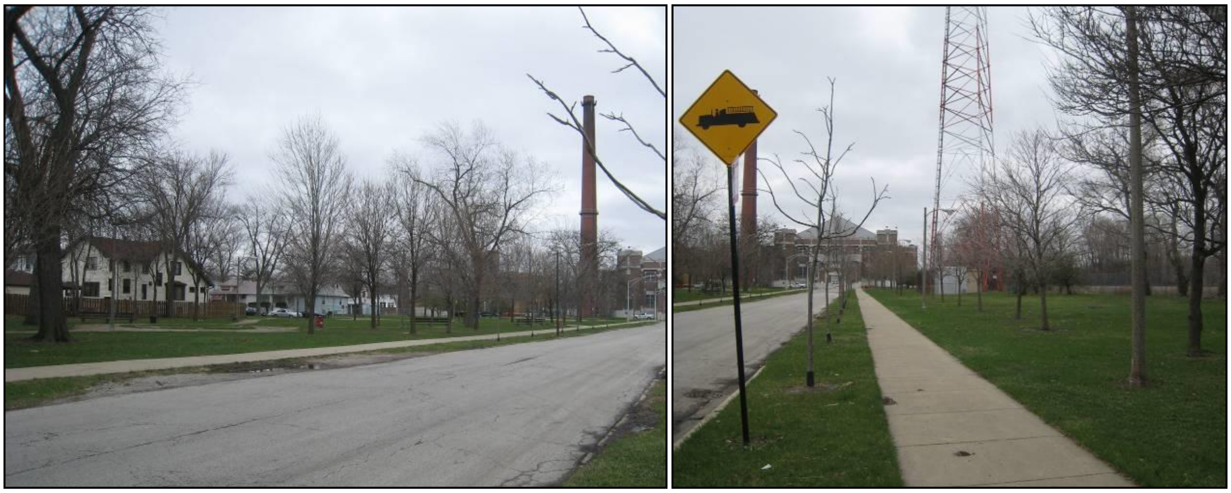

Figure 8-8: Photos of East Parcel (left) and West Parcel (right) of Block Park (Facing South)

Section 4(f) Use Assessment

The East Option alignment would run through the west parcel of Block Park, and the elevated structure and its associated clearances would overlap 0.9 acre of park space, as shown in **Figure 8-9**. Elevated track structure supports would be placed permanently in the west parcel of the park space. An auxiliary station entrance would also be located in the park, along the western edge of the existing parcel. The affected parcel includes an isolated portion of the park's open space and a communications tower, and does not currently serve a recreational use. The key recreational features of the park, walking trails and benches, are on the other side of Harvard Avenue in the east parcel of the park.

Because the alignment would run through the west parcel of Block Park, there would be a permanent incorporation (direct use) of the park facilities. Some temporary closure of the overlapped area (west parcel) would be necessary during construction and be used permanently. The east parcel of the park would remain open during construction and there would be no temporary or permanent impacts on the protected attributes, features or activities of the park. There would be no noise impacts related to operation of the proposed project after construction of mitigation measures (noise barrier). Mitigation measures, further discussed below, would be implemented in advance of construction to the extent possible. Remaining land used (area not used for the structure) would be restored to a condition at least as good as that which existed before the project.

map id: 12_05

Figure 8-9: Impacts on Block Park - Union Pacific Railroad Alternative East Option

All Possible Planning to Minimize Harm

After implementation of the following proposed mitigation and enhancement measures, there would be no adverse impact on the features, attributes, and activities of the park. **Appendix Y** provides conceptual plans of Block Park and other replacement park options.

- Replacement of lands used (acreage) with lands of reasonably equivalent usefulness and location and of at least comparable value. The replacement land would be used to construct additional new park space in or near the Roseland community area to enhance parkland availability for the surrounding community. New park space created through this replacement acreage would be constructed in accordance with Chicago Park District standards and would facilitate Chicago Park District master planning goals and objectives.

- Restoration and landscaping of disturbed areas.

- Incorporation of design features where necessary to reduce or minimize impacts of use on the Section 4(f) property. Such features would be designed in a manner that would enhance the park but not adversely affect the safety of the transit facility.

While not related to the attributes, features, or activities of the park, additional mitigation measures would include coordination with the City of Chicago and the Federal Communications Commission regarding relocation of the communications tower.

Preliminary Section 4(f) Finding

Based on consideration of the proposed direct use as well as the proposed mitigation and enhancement measures, no adverse impacts on the attributes, features, or activities would result from the East Option; therefore, a *de minimis* finding is proposed for this Section 4(f) use.

The Chicago Park District has concurred with this No Adverse Effect determination with the commitment of proposed mitigation measures in its letter dated August 17, 2015 (see **Appendix C**).

A public involvement process would be held in conjunction with the required NEPA public involvement process after publication of the Draft EIS for review and comment on this preliminary finding. During development of this Draft EIS, CTA and the Chicago Park District coordinated on several potential locations for new/replacement park space. **Appendix Y** provides conceptual plans for potential replacement parks based on this coordination. These locations and conceptual plans will be shared with the public for input as part of the Draft EIS public hearing.

FTA will consider public comment and the availability of the replacement park in determining whether the preliminary *de minimis* impact determination within this Draft EIS is appropriate. Based on FTA's finding and public input, a preferred location for replacement parkland will be identified as part of the Final EIS. The final location of the replacement park will be confirmed and secured based on ability to acquire property voluntarily, following the completion of the environmental phase of this project.

Agency Coordination and Consultation

Coordination with the agency with jurisdiction over the property, the Chicago Park District, is ongoing and will continue through development of the Final EIS. Early coordination meetings were held on April 18, 2011; July 23, 2013; May 8, 2014; and April 8, 2015 to provide Chicago Park District staff with information on the purpose and need for the project, identification and refinement of alternatives, and potential impacts on parks, and to discuss proposed mitigation measures. The Chicago Park District provided its concurrence on August 17, 2015 that after implementation of the proposed mitigation measures there would be no adverse impact on parks from either alignment option. Additional coordination meetings were held to further develop and refine proposed mitigation measures on October 8, 2015; March 10, 2016; April 6, 2016; May 18, 2016; and June 15, 2016. This coordination will continue as public input is obtained and in finalizing replacement park options and other mitigation measures in the Final EIS. The Chicago Park District has indicated that it regards this project as an opportunity to expand and enhance park activities and overall connectivity in the community once mitigation measures are in place.

8.6 Union Pacific Railroad Alternative West Option Section 4(f) Evaluation

During construction of the West Option, there would be temporary and minor construction activities within Wendell Smith Park for a short duration. These temporary construction activities, further described below, would not rise to a level of Temporary Occupancy under Section 4(f) and there would be no permanent use of the park under Section 4(f).

One Section 4(f) park property would be used as result of the West Option—Fernwood Parkway, which is further evaluated in this section.

8.6.1 Wendell Smith Park

Description and Significance of Property

Section 8.5.1 provides a full description and pictures of Wendell Smith Park.

Section 4(f) Use Assessment

The West Option alignment would be located near the existing park, but would not permanently use any parkland. Due to the proximity of the West Option alignment to the park, during construction there would likely be temporary closure of a small portion of the northwest corner of the park (approximately 0.1 acre) while the tracks are constructed and piers are installed. This closure would be temporary (expected to be no more than 3 to 4 months as piers are installed).

There would be no permanent incorporation of Wendell Smith Park proposed under the West Option, because no land from this park would be used for the project. There would be a short-term closure of the northwest corner of the park (approximately 0.1 acre) during construction, but this closure would not rise to the level of temporary occupancy under 23 CFR § 774.13. The total closure time of 3 to 4 months of this small portion of the park would be substantially less than the total time needed for construction and there would be no change in ownership of the land. The work proposed would be minor, and due to the proximity of the park to the elevated track it would have minimal impact on the property during construction and no permanent physical impact on the park. The temporarily used land would be fully restored to a condition at least as good as that which existed before the project.

Public use of the park would continue throughout construction of the project, and construction would not affect the attributes, features, or activities of the park. There would be no noise impacts related to operation of the proposed project after construction of mitigation measures (noise barrier). If there were any impact on the existing walking trail during these construction activities, the affected portion of the walking trail would be temporarily relocated within the park. No impacts on existing trees are expected to occur as a result of construction activities. Should any trees need to be cut to allow for activities, the trees would be replaced. Appropriate construction BMPs would be followed to shield construction activities, allow use of the property by the general public, and minimize any safety risks.

The Chicago Park District provided its concurrence on August 17, 2015 that after implementation of the proposed mitigation measures there would be no adverse impact on any parks from either alignment option. Based on these factors and the nature of the minor construction-related work proposed, the temporary construction proposed under the West Option would not rise to the level of temporary occupancy of Wendell Smith Park and there would therefore be no use of the park under Section 4(f).

8.6.2 Fernwood Parkway

Description and Significance of Property

Fernwood Parkway is a passive green space in Washington Heights that extends from 95th Street to 103rd Street. The parkway is divided into four parcels, two of which are north of I-57 and two of which are south of I-57. The two parcels south of I-57 are separated by 101st Street. The northern parcel, from 99th Street to 101st Street, is approximately 2.4 acres (78 feet wide by 1,325 feet long). The southern parcel, from 101st Street to 103rd Street, is approximately 2.9 acres (78 feet wide by 1,277 feet long). Both the north and south parcels of Fernwood Parkway serve as open space and do not contain recreational facilities or amenities such as sidewalks or benches. Some trees are planted within the park and a chain-link fence separates the green space from the existing at-grade UPRR tracks. **Figure 8-10** and **Figure 8-11** show Fernwood Parkway facing north and south.

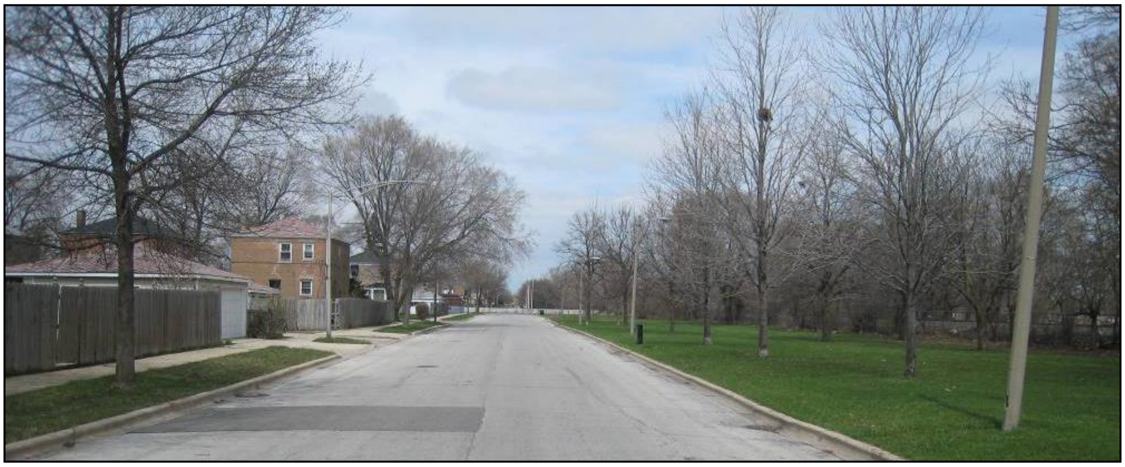

Figure 8-10: Photo of Fernwood Parkway at 100th Street and Eggleston Avenue (Facing North)

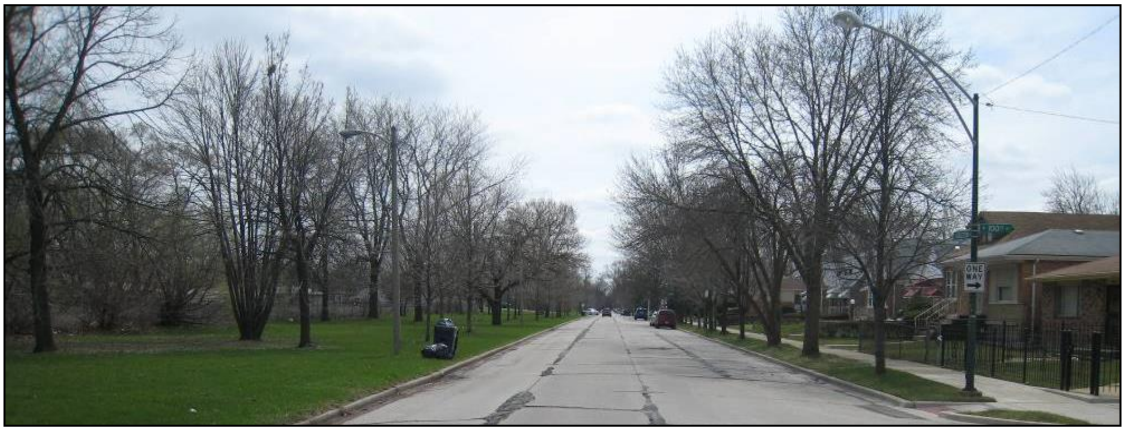

Figure 8-11: Photo of Fernwood Parkway at 100th Street and Eggleston Avenue (Facing South)

Section 4(f) Use Assessment

The West Option track structure would run through two of the four parcels that make up Fernwood Parkway between 101st and 103rd Streets. Elevated track structure supports would be placed permanently in the parkway. Approximately 1.9 acres of the parkway would be overlapped by the elevated structure and its associated clearances (see **Figure 8-12**). The parkway functions as open space, and does not contain recreational amenities.

The West Option would result in a permanent incorporation of the park space, which constitutes use under Section 4(f). Temporary closure of the overlapped section of the parkway would be necessary during construction. Elevated track structure supports would be placed permanently in the park space. There would be no noise impacts related to operation of the proposed project after construction of mitigation measures (noise barrier). Mitigation measures, further discussed below, would be implemented in advance of construction to the extent possible. Except for the piers that would be placed in the park, the land used would be restored to a condition at least as good as that which existed before the project.

Figure 8-12: Impacts on Fernwood Parkway - Union Pacific Railroad Alternative West Option

All Possible Planning to Minimize Harm

After implementation of the following proposed mitigation and enhancement measures, there would be no adverse impact on the features, attributes, and activities of the park. **Appendix Y** provides conceptual plans of Fernwood Parkway and other replacement park options.

- Replacement of lands (acreage) used with lands of reasonably equivalent usefulness and location and of at least comparable value. The replacement land would be used to construct replacement park space in or near the Washington Heights community area to enhance parkland availability for the surrounding community. New park space created through this replacement acreage would be constructed in accordance with Chicago Park District standards and would facilitate Chicago Park District master planning goals and objectives.

- Potential installation of a new bicycle path beneath the elevated track structure, subject to use for CTA maintenance, which would enhance the existing unused green space and better connect parks and the newly proposed transit infrastructure. Additional coordination with CDOT as part of the Final EIS will finalize the feasibility of this measure.

- Restoration and landscaping of disturbed areas.

- Incorporation of design features where necessary to reduce or minimize impacts of use on the Section 4(f) property. Such features would be designed in a manner that would enhance the green space but not adversely affect the safety of the transit facility.

Preliminary Section 4(f) Finding

Based on consideration of the proposed direct use as well as the proposed mitigation and enhancement measures, no adverse impacts on the attributes, features, or activities would result from the West Option; therefore, a *de minimis* finding is proposed for this Section 4(f) use. There are no physical features requiring replacement, and replacement parkland proposed as mitigation would replace this linear open green space near existing at-grade rail with more enhanced opportunities for active recreation park space within or near the surrounding community. Additional potential for bicycle paths beneath the elevated track structure could enhance connectivity between the proposed transit facility and other nearby community facilities.

The Chicago Park District has concurred with this no adverse effect determination with the commitment of proposed mitigation measures in its letter dated August 17, 2015 (see **Appendix C**).

A public involvement process would be held in conjunction with the required NEPA public involvement process after publication of the Draft EIS for review and comment on this preliminary finding. During development of this Draft EIS, CTA and the Chicago Park District coordinated on several potential locations for new/replacement park space. **Appendix Y** provides conceptual plans for potential replacement parks based on this coordination. These locations and conceptual plans will be shared with the public for input as part of the Draft EIS public hearing.

FTA will consider public comment and the availability of the replacement park in determining whether the preliminary *de minimis* impact determination is appropriate. Based on FTA's finding and public input, a preferred location for replacement parkland will be identified as part of the

Final EIS. The final location of the replacement park will be confirmed and secured based on ability to acquire property voluntarily, following the completion of the environmental phase of this project.

Agency Coordination and Consultation

Coordination with the agency with jurisdiction over the property, the Chicago Park District, is ongoing and will continue through development of the Final EIS. Early coordination meetings were held on April 18, 2011; July 23, 2013; May 8, 2014; and April 8, 2015 to provide Chicago Park District staff with information on the purpose and need for the project, identification and refinement of alternatives, and potential impacts on parks, and to discuss proposed mitigation measures. The Chicago Park District provided its concurrence on August 17, 2015 that after implementation of the proposed mitigation measures there would be no adverse impact on parks from either alignment option. Additional coordination meetings were held to further develop and refine proposed mitigation measures on October 8, 2015; March 10, 2016; April 6, 2016; May 18, 2016; and June 15, 2016. This coordination will continue as public input is obtained and in finalizing replacement park options and other mitigation measures in the Final EIS. The Chicago Park District has indicated that it regards this project as an opportunity to expand and enhance park activities and overall connectivity in the community once mitigation measures are in place.

8.7 Next Steps

This Draft EIS provides information on preliminary findings of *de minimis impact* for the UPRR Alternative East and West Option Section 4(f) uses. These preliminary findings include all possible planning to minimize harm to the extent possible with the conceptual engineering details available to date, in accordance with 23 CFR § 774.7(e)(1).

In addition, public review and comment is required for input into these preliminary *de minimis impact* findings. During development of this Draft EIS, CTA and the Chicago Park District coordinated on several potential locations for new/replacement park space. **Appendix Y** provides conceptual plans of the affected parks and other replacement park options. These locations and conceptual plans will be shared with the public for input as part of the Draft EIS public hearing.

Based on the results from these coordination activities, in the Final EIS and ROD FTA will confirm and finalize the findings by reference to the documentation included in this Draft EIS. Concurrence from the Chicago Park District, as the agency with jurisdiction over Section 4(f) properties evaluated in this chapter, is required to confirm these preliminary findings. Correspondence from the Chicago Park District confirming FTA's determinations will be included in the Final EIS.

The Final EIS will confirm whether the East or West Option is the selected option, and a preferred replacement park site will be identified based on public input. During the Final EIS and based on public feedback on park replacement sites, CTA will conduct outreach to property owners to determine availability of land and ability to acquire replacement property. As part of the Final EIS, additional coordination with the Chicago Park District will occur as well. The Final EIS will lay out the process to be conducted between CTA and the Chicago Park District to further identify replacement park locations should any of the identified replacement park options not be available at the time of property acquisition. The final park replacement site will be acquired in coordination with the Chicago Park District after completion of the environmental phase of this project (i.e., after FTA issues a ROD for the Final EIS). Additional environmental documentation in the form of a Phase I ESA per Chicago Park District requirements for developing new parks will be conducted before construction of the replacement park. CTA will also coordinate with CDOT as part of the Final EIS regarding potential installation of a new bicycle path beneath the elevated track structure at Fernwood Parkway if the West Option is selected.

Any new or more detailed engineering information available during the preparation of the Final EIS and ROD that could raise new Section 4(f) concerns not already considered herein would be included in that final documentation. If for any reason FTA determines that additional Section 4(f) analysis is required, additional Section 4(f) analysis will be prepared as part of the Final EIS.

Chapter 9
Evaluation of Alternatives

This chapter evaluates the alternatives with two comparisons. First, this chapter reviews and compares the capital expenditures (e.g., construction costs) and operations and maintenance (O&M) costs associated with the East and West Options. The potential funding sources and financing approaches under consideration for the project area are described. Second, this chapter compares the benefits and impacts of the East and West Options.

9.1 Potential Capital and Operating Funding Strategies

The purpose of this analysis is to provide a financial comparison of the East and West Options. Capital and O&M costs included in the analysis reflect the results of planning and engineering completed to date to support the technical analyses in the Draft EIS. These costs and potential revenue sources will be refined to reflect more detailed engineering and operational planning that will be conducted as the project moves through FTA's project development process and to reflect changes in available funding sources and financing approaches.

CTA would prepare a detailed financial plan to support CTA's request for funding through the FTA Section 5309 Capital Investment Grant (CIG) Program. This future detailed financial plan will document CTA's ability to fund construction and operation of the project within FTA requirements for grants awarded under the Section 5309 CIG Program. This initial analysis completed for the Draft EIS and the more detailed future financial plan will assist FTA, CTA, cooperating and participating agencies, and the public in understanding and evaluating CTA's financial capacity to construct and operate the RLE Project and to continue to operate and maintain the existing transit system.

Costs and revenues presented in this chapter are in FY 2015 base year dollars and in year of expenditure (YOE) dollars. YOE dollars reflect the financial impact of funding that would need to be expended in the actual YOE and the relative effects of inflation on costs and revenues. Annual and compounded inflation rates and the preliminary implementation schedules are used to project base year dollars to YOE dollars. For example, in YOE dollars, $3.00 in 2015 is equivalent to $3.18 in 2017, using an annual inflation rate of 3.0 percent.

9.1.1 Capital Cost Estimates

Reflecting engineering and planning completed to support the Draft EIS, the base year capital costs are estimated to be $1,716 million (2015 dollars) for the East Option and $1,746 million (2015 dollars) for the West Option.

For the Draft EIS, the base year capital cost estimates were originally prepared in 2013 dollars and have been escalated to 2015 base year dollars using the annual and compound annual construction cost growth rates summarized in **Table 9-1**. The annual construction cost growth rates reflect the January 2013 R.S. Means Construction Cost Index Forecast for Chicago, IL that was prepared for the RLE Project.

Table 9-1: Annual Inflation Rates

Year	Annual Construction Cost Growth Rate	Compound Annual Construction Cost Growth Rate
2015	-	1.00
2016	3.65%	1.04
2017	3.66%	1.07
2018	3.58%	1.11
2019	3.50%	1.15
2020	3.43%	1.19
2021	3.36%	1.23
2022	3.30%	1.27
2023	3.25%	1.31
2024	3.19%	1.36
2025	3.14%	1.40
2026	3.08%	1.44
2027	3.04%	1.48
2028	2.99%	1.53

Source: Moody's Analytics 2013, Financial Plan for Chicago Transit Authority's Red Line Extension Project

Additionally, for the YOE analysis, CTA escalated capital costs from 2015 base year dollars using the R.S. Means Construction Cost Index combined with preliminary implementation schedules for the East and West Options as summarized in **Table 9-2**. The table summarizes the percent of construction activities expected to be completed by year (cost curve), which was used to estimate the annual capital costs for the East and West Options over the FY 2016 to FY 2028 period. As the selected option moves through FTA's project development process, this implementation schedule will be revised to reflect future federal approvals, detailed engineering, and funding availability.

Table 9-2: Preliminary Implementation Schedule Cost Curve Assumptions

Year	Union Pacific Railroad Alternative East Option	Union Pacific Railroad Alternative West Option
2016	1.2%	1.2%
2017	1.9%	1.9%
2018	1.6%	1.6%
2019	2.8%	2.8%
2020	5.4%	5.6%
2021	7.9%	8.3%
2022	17.7%	17.6%
2023	23.8%	23.7%
2024	32.4%	32.1%
2025	5.1%	5.0%
2026	0.0%	0.0%
2027	0.1%	0.1%
2028	0.1%	0.1%
Total	**100.0%**	**100.0%**

Based on the projected annual construction cost growth rates and preliminary implementation cost curve assumptions above, the total capital costs would be $2,260 million (YOE dollars) for the East Option and $2,300 million (YOE dollars) for the West Option. **Figure 9-1** summarizes the estimated annual costs for the East and West Options. As shown in the figure and reflecting the cost curve assumptions, between FY 2016 and FY 2021 costs reflect engineering, right-of-way acquisition, utility relocation, and construction staging activities. Construction and acquisition of rail cars would occur between FY 2022 and FY 2025. Start-up activities, including testing, would occur in FY 2025, and project close-out and remaining professional services activities, including FTA's Before and After Study requirements, would be completed in FY 2027–2028.

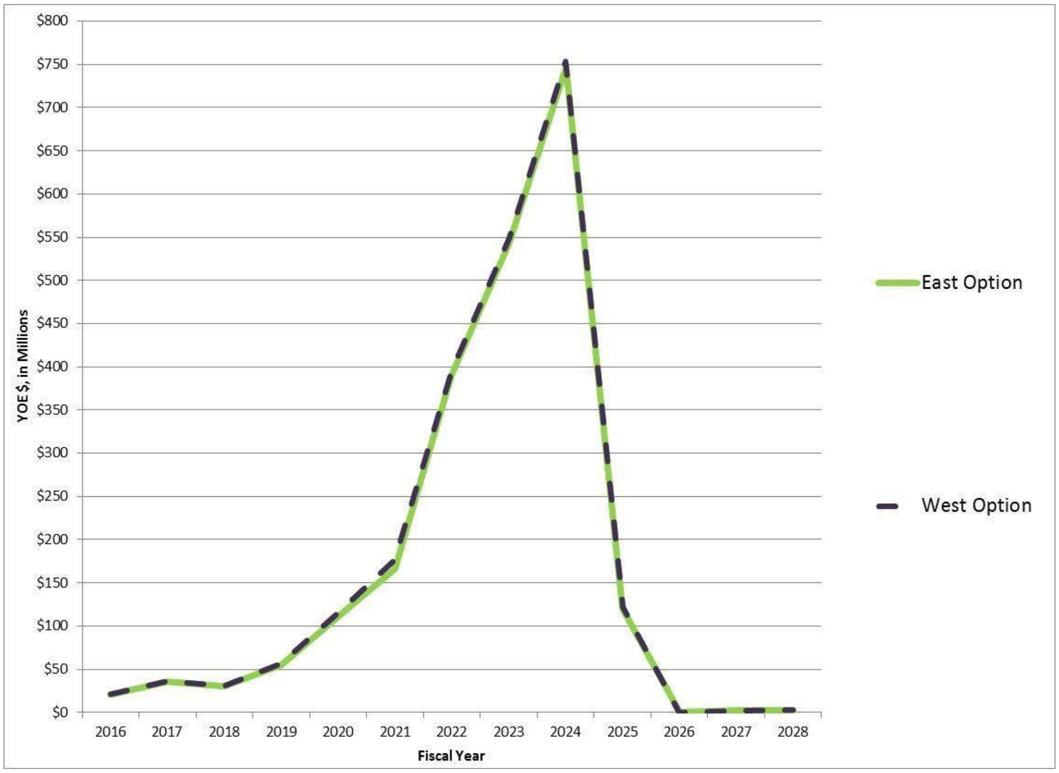

Figure 9-1: Annual Capital Cost Estimates (Year of Expenditure Dollars, in Millions)

9.1.2 Potential Capital Funding Sources and Financing Options

The potential funding sources and financing mechanisms described below reflect an initial list that could support the implementation of either the East or West Option. At this stage of project development, the funding analysis assumes a 49 percent (approximately $1,100 million YOE dollars) contribution from the FTA Section 5309 CIG Program (New Starts), and 51 percent funding from non-New Starts sources.

Potential Capital Funding Sources

Below are summary descriptions of the Section 5309 CIG Program and potential traditional and innovative approaches CTA could consider to fund the non-New Starts share of total project costs. As the selected option continues through the FTA project development process, CTA will determine the specific sources and levels of funding to cover the non-CIG Program share. This is consistent with CTA's traditional project implementation approach of working with the public and key stakeholders to determine the preferred alternative before requesting funds.

- FTA Section 5309 CIG Program (New Starts) - CTA intends to seek CIG funding from FTA for one or more of the alternatives examined in this NEPA document. The CIG Program, more commonly known as the New Starts, Small Starts, and Core Capacity Program, involves a multiyear, multistep process that project sponsors must complete before a project is eligible for funding. The steps in the process and the basic requirements of the program can be found on FTA's website at www.fta.dot.gov.

FTA must evaluate and rate proposed projects seeking funding from the CIG Program on a set of project justification and local financial commitment criteria specified in law. The criteria evaluate the merits of the project and the projects sponsor's ability to build and operate it as well as the existing transit system. FTA assigns ratings from low to high based on information that project sponsors submit on the project cost, benefits, requested amount of CIG Program funds, and overall financial plan. Projects must receive a medium or better overall rating to advance through the steps in the process and be eligible for funding from the program. As projects proceed through the steps in the process, information concerning costs, benefits, and impacts is refined and the ratings are updated to reflect new information.

As stated above, the financial analysis completed for the Draft EIS assumes CTA will pursue CIG Program funds through a New Starts Full Funding Grant Agreement of approximately 49 percent of the total project costs.

- Other Federal Funding Programs - In addition to the proposed New Starts funding, CTA could pursue the use of other federal funding programs to support implementation of the selected option. The total federal funding share for the project (New Starts plus other federal funding programs) cannot exceed 80 percent. The other federal funding programs under consideration include the FHWA programs and the USDOT Competitive Grant Program listed below.

  - FHWA Funding - Funding from these programs would be eligible to be "flexed" (transferred) to FTA to support implementation of transit capital investment projects. These funds are programmed by CMAP and would require adoption in the Long Range Transportation Plan and TIP to be used to fund a portion of the selected option's capital costs. Flexible FHWA funding sources include the following:

    - Congestion Mitigation and Air Quality Program - These funds are available for transportation projects likely to reduce congestion and to contribute to the attainment or maintenance of one or more NAAQS, with a high level of effectiveness in reducing air pollution.

    - Surface Transportation Program - This program provides funding for projects that preserve and improve the conditions and performance on any federal-aid highway, bridge and tunnel projects on any public road, pedestrian and bicycle infrastructure, and transit capital projects.

    - Transportation Alternatives Program - This competitive grant program could provide funding for non-motorized elements of the project.

  - USDOT Transportation Investment Generating Economic Recovery (TIGER) Program - The TIGER grant program was established as part of the Recovery Act in 2009 and is a competitive grant program to support implementation of "shovel ready" infrastructure projects, including highways, bridges, public transit, passenger and freight rail, port infrastructure, and intermodal facilities. Grants are made available for transportation projects of national and regional significance that contribute to the long-term economic competitiveness of the nation, improve the condition of existing transportation facilities and systems, increase energy efficiency and reduce GHG emissions, improve the safety of

U.S. transportation facilities, and/or enhance the quality of living and working environments of communities through increased transportation choices and connections.

  - Since 2009, USDOT has issued eight separate requests for TIGER applications. CTA was successful in obtaining a $20 million TIGER grant in 2012 for the 95th Street Terminal Improvements. For the RLE Project, a specific element of the overall project with independent utility (i.e., a stand-alone component of the overall project) would need to be identified to meet the TIGER grant eligibility requirements.

- State Funds - Historically the State of Illinois has provided funding assistance for CTA's major capital improvement projects. As the selected option moves through the project development process, CTA will work with State leaders to potentially include the project in future transportation funding packages. CTA could also pursue funding through the Illinois Transportation Enhancement Program (ITEP). ITEP is a competitive grant funding mechanism for Illinois transportation projects to improve pedestrian and bicycle accessibility and could potentially be used for street-level infrastructure improvements in conjunction with the RLE Project.

- Local/Private Funds - As part of the future detailed financial plan, CTA will evaluate opportunities to leverage existing and/or potential local revenue sources to fund specific project elements such as stations. This could include the use of value capture mechanisms such as special assessment districts or TIF districts. In special assessment districts, revenue is generated from a fee on properties in a specified area that is used to pay a portion of the capital improvements made within and specifically benefiting that area. In an assessment district, a connection between benefit received and cost charged is essential, in that assessments charged in these districts must be proportional to and no greater than the benefit to the assessed property. A TIF district reflects a concept where existing facilities and planned capital improvement projects would result in increased property taxes within the defined geographic area. The incremental revenue increase can then be used to support further capital investment within the district. Within the project area there are currently three TIF districts that could potentially provide funding to the project: 107th/Halsted TIF District (includes the site of the 111th Street station), Roseland/Michigan TIF District (includes the site of the Michigan Avenue station), and the Lake Calumet Industrial Corridor TIF District (includes the site of 120th Street yard and shop).

  Additionally, on June 30, 2016, the Illinois General Assembly approved a modified form of TIF to raise local revenues to fund the following four major transit improvements in Chicago and adjacent municipalities: the RLE Project, the RPM Program, Union Station improvements, and the Blue Line Modernization Project. These new districts will be called Transit Facility Improvement Areas (TFIA) and would use incremental property tax revenue to fund improvements. A TFIA as defined in the legislation is an area whose boundaries are no more than ½ mile in any direction from the location of a mass transit facility, provided that the length of any existing or proposed right-of-way included in any transit facility improvement area does not exceed 6 miles. The TIF district for a TFIA will have a 50-year life. Transit capital expenses, including costs related to the construction, reconstruction, rehabilitation, remodeling, or repair of any existing or proposed transit facility, whether publicly or privately owned or servicing debt issued for transit capital expenditures, are the only eligible expenses for revenue collected with the new TIF districts.

Traditional and Innovative Financing Approaches

Below is an overview of traditional federal and local financing mechanisms, as well as potential innovative public-private partnership financing, that could be used to accelerate implementation of the selected option. A new source(s) of funding would be required to repay these potential financing mechanisms. CTA is working with regional and state partners to evaluate a variety of potential new revenue sources and/or expansion of existing revenue sources that would support transportation improvements throughout the region. The potential sources could include new or increased levels of state, county, and local taxes, as well as potential value capture mechanisms such as assessment districts and TIFs, including the newly created TFIA districts.

- Transportation Infrastructure Finance and Innovation Act (TIFIA) Loan - TIFIA provides federal credit assistance (financing) for eligible projects of regional and national significance. TIFIA credit assistance provides improved access to capital markets, flexible repayment terms, and potentially more favorable interest rates than can be found in private capital markets for similar financing instruments. TIFIA can help advance qualified, large-scale projects that otherwise might be delayed or deferred because of size, complexity, or uncertainty over the timing of revenues. Given the flexible repayment terms and favorable interest rates, TIFIA finance has become an increasingly popular financial tool for transportation agencies. A challenge for future financing through TIFIA was the recent 70 percent reduction in annual program funding, from $1.0 billion to $287 million, with the December 2015 passage of the FAST Act. In April 2014, CTA was successful in obtaining CTA's first TIFIA Loan of $79.2 million for the 95th Street Terminal Improvement Project.

- CTA Bonds - CTA's existing debt financing is composed primarily of four different types of long term bonds: Sales and Transfer Tax Receipts Revenue Bonds, Sales Tax Receipts Revenue Bonds, Building Revenue Bonds, and Capital Grant Receipts Revenue Bonds. As the project moves forward in the project development process, CTA will determine the most appropriate bonding mechanism to provide local support for the non-federal share of funding required for the project.

- Private Financing - Private financial participation could take a number of different forms, ranging from Private Activity Bonds, (where tax-exempt interest rates are made available to private issuers), to equity participation in particular project components including transit-oriented developments, parking, or other real estate-related investments.

9.1.3 Operating Cost Estimates

CTA's O&M Cost Model was used to compare the operating costs of the East and West Options to the No Build Alternative. Based on planning completed to date, it is assumed that both options would have the same rail operating plan and associated proposed changes to existing local bus service. As a result, the comparison of operating statistics and O&M costs to the No Build is the same for the East Option and West Option.

The version of CTA's O&M Cost Model used for the Draft EIS was calibrated to the agency's FY 2012 system-wide operating budget ($1,273.7 million) and estimates costs for system-wide rail and bus costs separately. The model allows CTA staff to evaluate the financial impact of different rail and bus operating plans compared to existing service levels based on changes to the key operating statistics shown in **Table 9-3**. As shown in **Table 9-4**, the unit costs from the O&M Cost Model have been inflated to 2015 dollars based on the Chicago Area Consumer Price Index Forecast provided in the 2013 *Moody's Analytics Financial Plan for Chicago Transit Authority's Red Line Extension Project* economic analysis.

Table 9-3 compares the annual operating statistics for the East and West Options to the No Build Alternative. Compared to the No Build Alternative, the East and West Options would provide substantially higher levels of rail service (hours and miles) while streamlining existing bus service levels as new rail service replaces current bus service.

Table 9-3: Key Operating Statistics - Union Pacific Railroad Alternative East and West Options Compared to the No Build Alternative

	Difference from No Build Alternative
Rail Characteristics	
Annual Train Hours	37,227
Annual Train Car Miles	5,489,502
Peak Trains	8
Peak Train Cars	64
Stations	4
Track Miles	10.6
Existing Bus Characteristics	
Revenue Bus Miles	-276,451
Revenue Bus Hours	-3,991
Peak Buses	6

Note: Rail and bus characteristics reflect service planning assumptions developed as part of the Draft EIS. Service levels may be adjusted in the future to reflect additional planning and actual ridership demand.

Table 9-4 summarizes the estimated impact on annual O&M costs attributable to each of the variables that drive O&M costs, in total for the East and West Options and as compared to the No Build Alternative. The estimated difference in annual operating costs is $17.4 million (2015 dollars) for either the East or West Option as compared to the No Build Alternative. This difference for either of the options represents approximately 1 percent of CTA's total FY 2015 O&M budget ($1,443.7 million).

Table 9-4: Impact on Operations and Maintenance Costs for the Union Pacific Railroad Alternative East or West Option Compared to the No Build Alternative (2015 dollars, in millions)

	CTA O&M Model Unit Costs (2015$)	Difference from No Build Alternative (2015$)
Rail Variables		
Annual Train Hours	173.77	6.5
Annual Car Miles	2.03	2.6
Peak Trains	259,179.20	2.1
Peak Cars	32,216.70	2.1
Stations	647,739.00	2.6
Track Miles	259,259.05	2.7
Existing Bus Variables		
Revenue Bus Miles	3.91	(1.1)
Revenue Bus Hours	82.88	(0.3)
Peak Buses	52,564.05	0.3
Total[1]		**17.4**

O&M = Operations and Maintenance

[1] Total may not match due to rounding

Note: While the capital cost estimate includes costs associated with the construction of park & ride spaces, the O&M cost estimate does not include operating expenses for the park & ride facilities. The O&M cost estimate assumes CTA will contract with an outside company to manage and operate the park & ride facilities. This assumption is consistent with CTA's current contract with CPS Chicago Parking LLC to operate and manage existing park & ride facilities.

9.1.4 Potential Operating Revenue Sources

CTA would use the following system-generated and public funding sources to fully fund the O&M costs of the selected option as well as system-wide rail and bus operations:

- System-Generated Revenues - Fares and passes; reduced fare subsidy; advertising, charters and concessions revenues; investment income revenue; statutory required contributions from the City of Chicago and Cook County; and other revenues includes parking charges, rental revenue, third-party contractor reimbursements, and filming fees, among other income sources.

- Public Funding - The amount of public funding available for CTA operations is determined by the Regional Transportation Authority. Public funding has three sources: sales tax revenue, public transportation funds, and the real estate transfer tax. The three funding sources are authorized under Illinois statutes passed in 1983 and 2008.

9.2 Comparison of Alternatives

This section summarizes information from the other chapters of this Draft EIS and highlights important trade-offs between the East and West Options. Key points of comparison include project benefits, potential to meet purpose and need goals, environmental impacts, and costs.

9.2.1 Evaluation Goals and Criteria

CTA used the following evaluation goals and criteria to compare the benefits and drawbacks of the East and West Options. These goals reflect CTA's desire to provide enhanced transit service and promote economic development in the project area in a fiscally sound manner while minimizing adverse environmental impacts. For each goal, this evaluation applied the criteria listed below to determine the extent to which the East and West Options would meet that goal.

These goals are based on the purpose and need (**Chapter 2** of the Draft EIS), the AA process, comments received during scoping, public involvement, and the environmental analysis in **Chapters 3–7** of this Draft EIS.

Goal 1 - Reduce Transit Times

Goal 1 is evaluated based on the following criteria:

- Reduce transit times for residents, from within and south of the project area to the 95th Street Terminal and the Loop.
- Provide direct access to the CTA rail system for transit-dependent populations.
    - New stations convenient to transit-dependent communities
    - Direct service to public housing such as Altgeld Gardens

Goal 2 - Increase Travel Choices

Goal 2 is evaluated based on the following criteria:

- Provide better transit access to regional employment centers and local commercial areas.
- Allow for potential connections to other public transportation modes including regional commuter rail.
- Reduce geographic isolation of the project area and improve connections to major activity centers.
- Provide opportunities for drivers commuting on expressways to park and use transit to complete their trips.
    - Number of stations with park & ride facilities
    - Total park & ride spaces

Goal 3 - Increase Economic Competitiveness

Goal 3 is evaluated based on the following criterion:

- Foster economic development in the project area by providing stations that can encourage nearby development.

Goal 4 - Minimize Environmental Impacts

Goal 4 is evaluated based on minimizing environmental impacts:

- Displacement and Relocation Impacts

- Noise Impacts
- Park Impacts
- Community Character Impacts
- Visual and Aesthetic Impacts

Goal 5 - Provide the Best Value

Goal 5 is evaluated based on the following criteria:

- Projected ridership
- Capital costs to construct the project
- Changes in operating and maintenance costs for the system

9.2.2 Evaluation Results

Table 9-5 provides specific measurements for the goals identified in **Section 9.2.1**, and compares the extent to which the East and West Options and the No Build Alternative would meet the goals.

Table 9-5: Comparative Evaluation of Alternatives

Criteria	No Build Alternative	Union Pacific Railroad Alternative East Option	Union Pacific Railroad Alternative West Option
Goal 1 - Reduce Transit Times			
Travel Times Between Stations[1,2] 130th Street to 95th Street Terminal 130th Street to Jackson Station (Loop)	 28 minutes 58 minutes	 14 minutes 39 minutes	 14 minutes 39 minutes
Would the proposed stations serve transit-dependent communities?	No	Yes	Yes
Would there be new direct service to Altgeld Gardens?	No	Yes	Yes
Goal 2 - Increase Travel Choices			
Would there be better access to regional employment centers and local commercial areas?	No	Yes	Yes
Would potential connections to other public transportation modes within the project area be possible?	No	Yes	Yes
Would geographic isolation be reduced?	No	Yes	Yes
How many stations would have park & ride facilities?	0	4 of 4	4 of 4
Total Park & Ride Spaces	0	3,700	3,700
Goal 3 - Increase Economic Competitiveness			
Could nearby development be encouraged?	No	Yes	Yes

Criteria	No Build Alternative	Union Pacific Railroad Alternative East Option	Union Pacific Railroad Alternative West Option
Goal 4 - Minimize Environmental Impacts			
Displacements and Relocations			
Properties	0	260	205
Buildings	0	106	46
Residential Buildings	0	90	26
Mixed-Use Buildings	0	1	2
Commercial and Industrial Buildings	0	13	17
Places of Worship	0	1	1
City-Owned Buildings	0	1	0
Noise Impacts After Mitigation	No change	Not adverse	Not adverse
Receivers with Moderate Impacts (before mitigation/after mitigation)	0	574/0	738/0
Receivers with Severe Impacts (before mitigation/after mitigation)	0	83/0	49/0
Park Impacts (Not Adverse After Mitigation)[3]			
Construction Phase	0 parks	2 parks	2 parks
Permanent	0 parks	2 parks	1 park
Permanent (acres)	0 acres	1.6 acres	1.9 acres
Would there be community impacts after mitigation?	No	Yes	Yes
Would there be visual and aesthetic impacts after mitigation?	No	Yes	Yes
Goal 5 - Provide the Best Value			
Projected Ridership (per weekday)	0	42,000	42,000
Capital Costs[4]	$0	$2.26 Billion	$2.30 Billion
Annual Change in O&M Costs[5]	No Change	+$17.4 Million	+$17.4 Million

N/A = Not Applicable
[1] Source: CTA 2009
[2] Travel time between stations does not include wait time at 130th Street.
[3] Based on the Section 4(f) analysis. Findings contingent on continued coordination process.
[4] Year of expenditure dollars
[5] O&M = Operations and maintenance. Difference from No Build Alternative shown in year 2015 dollars

Based on the criteria above, both the East and West Options would meet the identified goals. The sections below provide further discussion of the evaluation.

Goal 1 - Reduce Transit Times

Under the No Build Alterative, transit times in the project area would remain the same. The East and West Options would reduce transit travel times between the project area and destinations along the existing CTA rail system. The build alternative options would extend the Red Line southward from the 95th Street Terminal, with no transfer at the 95th Street Terminal required. Both the East and West Options would include new stations in transit-dependent communities, which would provide residents with more mobility and better access to jobs and services. The 130th Street station would serve the residents of Altgeld Gardens. The East and West Options would provide enhanced mobility, particularly for project area residents who do not have access to a car, and would allow them easier access to regional employment and activity centers.

Goal 2 - Increase Travel Choices

The No Build Alternative would not provide any transit service improvements, and would therefore not increase travel choices in the project area.

The East and West Options would provide transit service to the project area and would provide better transit access to regional employment centers and local commercial areas. The East and West Options would allow for potential future connections to regional commuter rail, particularly to NICTD at the 130th Street station where the tracks are adjacent. The East and West Options would serve geographically isolated neighborhoods and improve their connections to regional job centers. With the extension of the Red Line, some existing bus routes would be rerouted to feed into the proposed stations. All stations for the East and West Options would include park & ride facilities for motorists wishing to park their cars and complete their trips using transit. These facilities would potentially attract motorists from the nearby expressways, and give project area residents and residents from the south suburbs of Chicago more options for accessing the enhanced transit service.

Goal 3 - Increase Economic Competitiveness

The new stations could serve as catalysts for development and neighborhood revitalization. The Michigan Avenue station park & ride facility would include ground-floor space for community facilities and retail, which would help offset the negative impacts of the required displacements. By providing new, high-quality transit service to communities that have experienced long-term disinvestment, the East and West Options could encourage improvement of local economic conditions for project area residents.

Goal 4 - Minimize Environmental Impacts

The No Build Alternative would not have any environmental impacts, but also would not improve transit service in the project area. It would therefore not fulfill the purpose and need of the RLE Project, and would not satisfy the criteria for the environmental goal. The East and West Options would have greater environmental impacts than the No Build Alternative, but would fulfill the purpose and need of the project. Mitigation measures to address the potentially adverse impacts are proposed in **Chapters 3–7**.

Both the East and West Options would require displacements along their proposed alignments. The East Option would require 106 building displacements, most of which would be residential. The West Option would require 46 building displacements, which would be a mix of residential, commercial, and industrial. Noise-sensitive receivers along the East and West Option alignments would have moderate and severe noise impacts before mitigation. Under the East Option, 574 noise-sensitive receivers would have moderate impacts, and 82 noise-sensitive receivers would have severe impacts. Under the West Option, 738 noise-sensitive receivers would have moderate impacts, and 48 noise-sensitive receivers would have severe impacts. Under both the East and West Options, CTA would construct a noise barrier approximately 4 feet in height along both sides of the elevated track structure from the 95th Street Terminal to the CN/ME tracks near 119th Street, to reduce noise to levels below FTA noise impact criteria. Impacts would not be adverse after mitigation.

Both the East and West Options would affect parks in the project area. The East Option would have permanent and construction impacts on Wendell Smith Park and Block Park. The East

Option would require the elevated structure to be built above the northwest corner of Wendell Smith Park and along the western parcel of Block Park. The West Option would have construction impacts on Wendell Smith Park and Fernwood Parkway and permanent impacts only on Fernwood Parkway. The West Option would require the elevated structure to be built above Fernwood Parkway between 99th and 103rd Streets. The East Option would permanently affect 1.6 acres of parkland, and the West Option would permanently affect 1.9 acres of parkland.

The placement of new elevated structures and park & ride facilities into existing communities would result in community character impacts that would remain adverse after mitigation under the East and West Options. The East Option would have adverse impacts on community character and cohesion despite mitigation because of the visual encroachment of the elevated structure into the neighborhood north of I-57 in Roseland and near 117th Street and Prairie Avenue in West Pullman. The West Option would have adverse impacts on community character and cohesion despite mitigation because of the visual encroachment of the elevated structure into the neighborhood north of I-57 in Roseland and between 99th and 103rd Street in Washington Heights, near the 103rd Street station in Washington Heights, and near the Michigan Avenue station park & ride facility in West Pullman.

Both the East and West Options would have adverse visual impacts despite mitigation. Under the East Option, the elevated track structure would create an adverse visual impact north of I-57 and at the intersection of 117th Street and Prairie Avenue. As part of the West Option, the elevated track structure would create an adverse visual impact north of I-57 and between 99th and 103rd Streets, and at the 103rd Street station.

Goal 5 - Provide the Best Value

The approximate capital costs of the East Option would be $2.22 billion in YOE dollars, and the approximate capital costs of the West Option would be $2.26 billion in YOE dollars. Projected annual O&M costs for the CTA system would increase by approximately $17.4 million for either the East or West Option. CTA developed the East and West Options to meet Goals 1–4 described above and to meet the goals in a cost-efficient manner.

Chapter 10
Public and Agency Coordination

This chapter and the *Agency Coordination and Public Involvement Appendix* (**Appendix C**) document the extensive outreach and coordination that FTA and CTA have undertaken for the RLE Project. CTA began public outreach on the project as part of the AA from 2006 to 2009. Outreach continued during the formal EIS scoping period in 2009, and has continued through the preparation of this Draft EIS starting in 2012.

10.1 Public Participation Plan

To ensure that the public was informed and had opportunities to comment at key milestones throughout the study, CTA developed a detailed Public Participation Plan (PPP) at the onset of the RLE scoping process and updated at the start of the Draft EIS phase. The PPP includes outreach goals, key issues, a detailed stakeholder database, communications protocols, public input tracking protocols, a proposed schedule for interfacing with the public, and recommendations for how meetings should be conducted at various stages of the study. The PPP also includes additional recommendations for individual stakeholder interviews or briefings, interagency coordination, and the formation of working groups. The PPP is included in **Appendix C**.

10.2 Agency Coordination

CTA has coordinated and will continue to coordinate with governmental and other agencies throughout the course of this project. Outreach efforts were conducted in compliance with NEPA and other applicable regulations, including Section 106 of the NHPA, Section 4(f) of the USDOT Act of 1966, joint guidance and regulations from FTA and FHWA, and other agency regulations and guidelines.

10.2.1 Section 106 Coordination

The effort to identify, contact, and consult with various interested groups and agencies to identify historic properties and cultural practices during the environmental planning process has been documented for the Section 106 consultation process (see also **Section 4.7**). The purpose of consultation was to identify historic resources and other concerns relating to the project's potential effects on historically important resources. FTA and CTA sought information from individuals and organizations likely to have knowledge of local potential resources. **Section 4.7** includes the list of consulting parties. Consultation meetings focusing on project introduction, eligibility review, and effects discussions were held on October 24, 2012, January 30, 2013, and May 8, 2014, as described in **Section 4.7**. **Appendix Q** contains copies of correspondence and Section 106 consultation materials. As described in **Section 4.7.4**, no adverse effects on historic resources would occur because of the RLE Project (East or West Option) and no mitigation measures would be required; therefore, consultation with consulting parties is complete. In correspondence to the SHPO dated September 21, 2016, FTA made the determination that the UPRR Alternative (East and West Options) would result in no adverse effects. Coordination with the SHPO related to concurrence with FTA's eligibility and effects determinations is ongoing and will continue through the remainder of the project.

10.2.2 Tribal Coordination

In July 2012, FTA sent invitation letters to 11 Native American tribes to inform them of the Section 106 process and request assistance in identifying areas with potential cultural and/or religious significance. Letters were sent to the following nations: the Ho-Chunk Nation, the Miami Tribe of Oklahoma, the Peoria Tribe of Indians of Oklahoma, the Sac and Fox Nation of Oklahoma, the Pokagon Band of Potawatomi Indians, the Prairie Band of the Potawatomi Nation, the Citizen Potawatomi Nation, the Forest County Potawatomi Nation, the Potawatomi Nation, the Sac and Fox Nation of Mississippi in Iowa, and the Sac and Fox Nation of Missouri. The Miami Tribe of Oklahoma, Peoria Tribe of Indians of Oklahoma, and the Forest County Potawatomi Nation responded confirming their participation in the Section 106 process; no response was received from the other tribes. Coordination with the tribes is ongoing and will continue through the remainder of the project.

10.3 Public Outreach

Community outreach for the RLE Project started with the AA, continued with NEPA scoping in 2009, and will continue through the Draft EIS and Final EIS phases of the project. CTA will continue to involve and consult with the community as the project proceeds through design. **Table 10-1** summarizes public meetings held to date.

Table 10-1: Public Meetings Held to Date

Meeting	Location	Date and Time	Number of Attendees
Alternatives Analysis Phase			
Screen 1	Chicago State University 9501 S. King Drive	April 10, 2007 6:00 to 8:00 PM	66
	Chicago Public Library - West Pullman 830 W. 119th Street	April 11, 2007 6:00 to 8:00 PM	81
Screen 2	Historic Pullman Visitor Center 11141 S. Cottage Grove Avenue	December 3, 2008 6:00 to 8:00 PM	43
	Chicago Public Library - Woodson Regional 9525 S. Halsted Street	December 4, 2008 6:00 to 8:00 PM	41
Screen 3	Olive Harvey College 10001 S. Woodlawn Avenue	June 3, 2009 6:00 to 8:00 PM	44
	Chicago Public Library - Woodson Regional 9525 S. Halsted Street	June 4, 2009 6:00 to 8:00 PM	67
Environmental Impact Statement Scoping Phase			
Scoping	Historic Pullman Visitor Center 11141 S. Cottage Grove Avenue	September 22, 2009 6:00 to 8:00 PM	87
Scoping	Chicago Public Library - Woodson Regional 9525 S. Halsted Street	September 24, 2009 6:00 to 8:00 PM	81
Draft Environmental Impact Statement Phase			
Open House	St. John Missionary Baptist Church 211 E. 115th Street	August 2, 2011 6:00 to 8:30 PM	96
Open House	Palmer Park Gymnasium 201 E. 111th Street	May 13, 2014 5:30 to 7:30 PM	212

10.3.1 Alternatives Analysis Phase

CTA conducted the RLE AA process between 2006 and summer 2009, during which time CTA regularly met with the public. Through presentations and displays, the public learned about the methods of the New Starts federal planning processes and how evaluation criteria were developed and applied to the universe of alternatives for the RLE AA. A formal question and answer process allowed the general public to make comments and ask questions on the study's findings. CTA conducted individual and group briefings for elected and public officials; community, civic, business and religious leaders; and other stakeholders, providing them the opportunity to comment and inquire about the project.

CTA held two public meetings in April 2007 to present the findings of Screen 1 of the AA study; a total of 147 people attended the meetings and 209 comments were received. Two public meetings were held in December 2008 to present the findings of Screen 2 of the AA study; a total of 84 people attended the meetings and 139 comments were received. Two public meetings were held in June 2009 to present the findings of Screen 3 of the AA study; a total of 111 people attended the meetings and 111 comments were received. The AA process concluded with the Chicago Transit Board adoption of an LPA in August 2009.

Detailed information about the public involvement that took place during the AA process is included in **Appendix A**.

10.3.2 Environmental Impact Statement Scoping Phase

The NEPA scoping process began in 2009 to inform the public about the project and gather input on the scope of the environmental studies, draft purpose and need, and alternatives to be evaluated. The *Scoping Report* (**Appendix B**) details all public and agency outreach activities associated with the NEPA scoping process. FTA published the Notice of Intent (NOI) in the Federal Register on September 9, 2009. The NOI initiated the NEPA scoping process and included notification of the dates and locations of the agency and public scoping meetings, the dates of the public comment period, and descriptions of the project purpose and need and alternatives. CTA accepted comments from the date of publication of the NOI in the Federal Register (September 9, 2009) through October 27, 2009. This schedule provided a public comment period of 57 days.

An agency scoping meeting was held on September 24, 2009 with 12 agencies and jurisdictions represented:

- Chicago Department of Community Development
- Chicago Department of Environment
- Chicago Department Streets and Sanitation
- CDOT
- Chicago Park District
- Chicago Police Department
- Detroit Department of Transportation
- Illinois Commerce Commission
- IDOT
- Illinois State Police, Chicago District
- Metra
- MWRD

CTA held two public scoping meetings to provide the public with an opportunity to comment on the project purpose and need, alternatives considered, and issues and areas of concern to be considered in the Draft EIS.

CTA publicized the meetings via direct mail and e-mail notices using the stakeholder database, postings on CTA's website, display advertisements in multilingual publications (English and Spanish), a legal notice placed in the Chicago Tribune, CTA customer alerts, postings at the 95th Street Terminal and on CTA buses and trains, flyers distributed to key locations along the project corridor, and notices posted in libraries and village halls. CTA held four meetings with elected officials from along the project corridor so they could notify their constituents.

The public scoping meetings were hosted in ADA-compliant locations in the project area, accessible by public transit. The public scoping meetings were held approximately four weeks in advance of the end of the public comment period. The scoping meetings began with a 45-minute open house format. During the open house session, project team members were present at project display boards to answer questions related to the technical aspects of the project. The open house session provided attendees with an opportunity to review the project information and clarify their understanding of the project and environmental process before the start of the presentation and subsequent comment period. After the open house period, a presentation was made to provide attendees with information regarding the purpose of scoping, the project purpose and need, project background, the recently completed AA process, and the alternatives being carried forward into the Draft EIS. After the presentation, there was a formal public comment session, which was recorded by a court reporter. Spanish translators and sign language interpreters were available during the meeting.

Agencies, community groups, members of the public, elected officials, and other interested parties submitted 352 letters, e-mails, comment cards, and verbal testimonies during the scoping comment period. The comments largely fell into three topic categories: the project purpose and need (approximately 7 comments); the alternatives to be studied in the Draft EIS, including alignment options, station location options, and potential design features (approximately 326 comments); and environmental impacts and mitigation measures (approximately 37 comments). Many comments related to several topics and may have been counted under more than one category to fully characterize the feedback for each topic.

10.3.3 Draft Environmental Impact Statement Phase

August 2011 Open House Meeting

CTA held an open house meeting on August 2, 2011 to update the community regarding the RLE Project. The meeting was held at St. John Missionary Baptist Church, 211 E. 115th Street in Chicago from 6:00 PM to 8:30 PM. A total of 96 people signed in at the open house.

CTA publicized the meeting via direct mail and e-mail notices using the stakeholder database, postings on CTA's website, display advertisements in multilingual publications (English and Spanish), CTA customer alerts, and a news release to local media outlets. CTA sent letters to participating agencies informing them of the project status and inviting them to the open house.

The open house meeting was hosted in an ADA-compliant location in the project area, accessible by public transit. An open house meeting format was used for the public meeting, during which project team members were present at project display boards to answer questions related to the technical aspects of the project. The open house provided attendees with an opportunity to review the project information and clarify their understanding of the project and environmental process. Spanish translators and sign language interpreters were available during the meeting. CTA collected written comments at the meeting and by mail, fax, and e-mail after the meeting. **Appendix C** provides additional details about the August 2011 open house.

Summer 2013 Newsletter

CTA sent a newsletter with a general project update to the approximately 3,200 addresses on the stakeholder database on August 27, 2013. **Appendix C** contains a copy of the newsletter.

Spring 2014 Outreach

CTA conducted outreach in April and May of 2014 to update the public on the status of the project; inform them of proposed alternatives, anticipated project benefits, and impacts; and gather feedback. Outreach included meetings with elected officials, interested community groups, and a public open house. The open house was held May 13, 2014 at the Palmer Park Gymnasium, 201 E. 111th Street in Chicago from 5:30 PM to 7:30 PM. The meeting was publicized using the methods described for the August 2011 open house. A total of 212 community members attended the meeting.

CTA received a total of 97 written comments from the community. Community members were asked to provide specific comments or concerns they had about alternatives, potential impacts, and mitigation measures. Overall, the community supports the RLE Project, and noted concerns related to property displacements, community and economic development, noise and vibration, safety and security, traffic, the project timeline, alternatives proposed, and alternative preferences. **Appendix C** provides additional details about the May 2014 open house.

10.4 Public Hearing and Public Comment Period

This Draft EIS serves as the primary document to facilitate review by agencies and the public of the proposed project. Comments on the Draft EIS will be accepted from October 6, 2016 to November 30, 2016. A copy of the Draft EIS is available on the CTA website (www.transitchicago.com/RedEIS), and hard copies of the Draft EIS are available at the following locations during the public review period:

- CTA headquarters, 567 W. Lake Street, 2nd Floor, Chicago, IL 60661
- Pullman Public Library, 11001 S. Indiana Avenue, Chicago, IL 60628
- West Pullman Public Library, 830 W. 119th Street, Chicago, IL 60643
- Altgeld Public Library, 13281 S. Corliss Avenue, Chicago, IL 60827
- Woodson Regional Public Library, 9525 S. Halsted Street, Chicago, IL 60628
- Calumet Park Public Library, 1500 W. 127th Street, Calumet Park, IL 60827
- Harold Washington Library Center, 400 S. State Street, Chicago, IL 60605

A public hearing is scheduled for November 1, 2016 from 5:30 to 7:30 PM at St. John Missionary Baptist Church (211 E. 115th Street, Chicago, IL 60628) to solicit comments from the community about findings presented in this Draft EIS. The public hearing was advertised through display ads in local and regional newspapers, an e-Blast, and through CTA press releases, flyers, and CTA customer alerts placed on CTA rail cars and buses within the project corridor. Additional details concerning the public hearing were also posted on CTA's website. The public hearing location is within the project area, ADA-compliant, and accessible by public transit.

Comments received during the public hearing will be reviewed by FTA and CTA, and will be entered into public record. Written comments will also be accepted at any time during the public comment period via e-mail to: RedExtension@transitchicago.com and U.S. mail to: Chicago Transit Authority, Strategic Planning, 10th Floor, Attn: Red Line Extension Project, 567 W. Lake Street, Chicago, IL 60661. A summary of the public hearing and responses to comments received will be included in the Final EIS.

10.5 Accommodations for Minority, Low-Income, and Disabled People

CTA made substantial efforts to ensure that minority, low-income, and disabled people were included in all outreach efforts. The efforts included sensitivity to multiple distribution channels and language needs, and all meetings were held in ADA-compliant facilities. CTA performed an LEP assessment in 2009, which determined that public outreach materials should be prepared in both English and Spanish. Meetings were advertised in multilingual and local publications. Spanish translators and sign language interpreters were made available at every public meeting.

In addition to direct mail and electronic notifications of meetings, CTA provided advance notice on buses and trains serving the project area to ensure that transit passengers were aware of opportunities to attend the meetings. Meeting notice materials included an offer of translation services in Spanish or other languages with advance request.

As noted, federal requirements for public participation plans include a process for seeking out and considering the needs of those traditionally underserved by existing transportation systems, such as minority and/or low-income groups. CTA actively worked with organized business and community groups in the project area and transit advocacy organizations to ensure that project information and public meetings were adequately publicized and had substantive participation by minority and low-income groups.

Chapter 11
List of Acronyms and Abbreviations

Acronym or Abbreviation	Definition
AA	Alternatives Analysis
ADA	Americans with Disabilities Act
APE	area of potential effects
API	area of potential impact
BMPs	best management practices
BRT	bus rapid transit
BTU	British thermal unit
CDOT	Chicago Department of Transportation
CEQ	Council on Environmental Quality
CERCLIS	Comprehensive Environmental Response, Compensation and Liability Information System
CERCLIS-NFRAP	Comprehensive Environmental Response, Compensation and Liability Information System - No Further Remedial Action Planned
CESQG	conditionally exempt small quantity generators
CFR	Code of Federal Regulations
CHRS	Chicago Historic Resources Survey
CIG	Capital Investment Grant
CMAP	Chicago Metropolitan Agency for Planning
CN	Canadian National
CN/ME	Canadian National/Metra Electric District
CO	carbon monoxide
Conrail	Consolidated Rail Corporation
CREATE	Chicago Region Environmental and Transportation Efficiency Program
CSS & SBRR	Chicago South Shore & South Bend Railroad
CTA	Chicago Transit Authority
dB	decibels
dBA	A-weighted decibels
DCP	Developing Communities Project, Inc.
EB	eastbound
EcoCAT	Illinois Ecological Compliance Assessment Tool
EDR	Environmental Data Resources, Inc.
EIS	Environmental Impact Statement
EJ	environmental justice
EJ populations	minority and low-income populations

Acronym or Abbreviation	Definition
ERNS	Emergency Response Notification System
ESA	Environmental Site Assessment
FAST	Fixing America's Surface Transportation Act
FHWA	Federal Highway Administration
FTA	Federal Transit Administration
FY	fiscal year
FQA	Floristic Quality Assessment
GHG	greenhouse gas
GO TO 2040	CMAP *GO TO 2040 Comprehensive Regional Plan*
HRT	heavy rail transit
IAAQS	Illinois Ambient Air Quality Standards
IDNR	Illinois Department of Natural Resources
IDOT	Illinois Department of Transportation
IEPA	Illinois Environmental Protection Agency
IHB	Indiana Harbor Belt Railroad
ILCS	Illinois Compiled Statutes
INAI	Illinois Natural Areas Inventory
ITEP	Illinois Transportation Enhancement Program
L_{dn}	day-night average sound level
LEP	limited English proficiency
L_{eq}	equivalent continuous sound level
LOS	level of service
LPA	Locally Preferred Alternative
LUST	leaking underground storage tank
L_v	vibration velocity
LQG	large quantity generator
MAP-21	Moving Ahead for Progress in the 21st Century Act
ME	Metra Electric District
MUTCD	Manual on Uniform Traffic Control Devices
MWRD	Metropolitan Water Reclamation District of Greater Chicago
NAAQS	National Ambient Air Quality Standards
NCHRP	National Cooperative Highway Research Program
NEPA	National Environmental Policy Act of 1969
NFR	No Further Remediation
NFRAP	No Further Remedial Action Planned
NHPA	National Historic Preservation Act
NICTD	Northern Indiana Commuter Transportation District
NICTD/CSS & SBRR	Northern Indiana Commuter Transportation District/Chicago South Shore & South Bend Railroad

Acronym or Abbreviation	**Definition**
NOI	Notice of Intent
NO_2	nitrogen dioxide
NPL	National Priority List
NRCS	Natural Resources Conservation Service
NRHP	National Register of Historic Places
NWI	National Wetlands Inventory
OSHA	Occupational Safety and Health Administration
O&M	operations and maintenance
O_3	ozone
Pace	Pace Suburban Bus Service
$PM_{2.5}$	particulate matter with an aerodynamic diameter of 2.5 micrometers and less
ppm	parts per million
PPP	Public Participation Plan
PRP	potentially responsible party
RCRA	Resource Conservation and Recovery Act
RLE	Red Line Extension
ROD	Record of Decision
RPM	Red and Purple Modernization
SAFETEA-LU	Safe, Accountable, Flexible, Efficient Transportation Equity Act: A Legacy for Users
SES	Southeast Service
SHPO	State Historic Preservation Office
SPILLS	Spill Incident List
SQG	small quantity generator
SRP	Site Remediation Program
SSU	Illinois State Sites Unit Listing
TFIA	Transit Facility Improvement Area
TIFIA	Transportation Infrastructure Finance and Innovation Act
TIF	tax increment financing
TIGER	Transportation Investment Generating Economic Recovery
TIP	Transportation Improvement Program
TSM	transportation system management
Uniform Act	Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970
UPRR	Union Pacific Railroad
USACE	U.S. Army Corps of Engineers
USC	United States Code
USDA	U.S. Department of Agriculture
USDOT	U.S. Department of Transportation

Acronym or Abbreviation	**Definition**
USEPA	U.S. Environmental Protection Agency
USGS	U.S. Geological Survey
UST	underground storage tank
VdB	decibels referenced to 1 microinch per second
VMT	vehicle miles traveled
WB	westbound
YOE	year of expenditure

Chapter 13
List of Preparers

Federal Transit Administration

Name	Qualifications	Primary Responsibilities
Mark Assam, AICP	Environmental Protection Specialist	FTA Review
Tony Greep	Community Planner	FTA Review

Chicago Transit Authority

Name	Qualifications	Primary Responsibilities
Carole Morey	Chief Planning Officer	CTA Review
Michael McLaughlin	Deputy Chief of Staff	CTA Review
Leah Dawson Mooney	Director of Strategic Planning and Policy	CTA Review
Sonali Tandon	Senior Project Manager	CTA Project Manager

Chicago Transit Partners

Name	Qualifications	Primary Responsibilities
John Conroyd, SE, LEED AP	Program Manager; BS Civil Engineering, MS Civil Engineering, and MBA; PE; SE; LEED AP; CMAA Certified Construction Manager; OSHA Certified; 30 years' experience	Draft EIS Review
Paul Swanson	Planning/Design Oversight Manager; BS Civil Engineering; 52 years' experience	Conceptual Engineering Review

CDM Smith

Name	Qualifications	Primary Responsibilities
Christopher Albrecht	Senior Project Manager; BS Biology, MS Environmental Biology; IL-licensed asbestos inspector/management planner; 26 years' experience	Hazardous Materials Analysis
Robert W. Ball, RPA	Cultural Resources Specialist; BS Anthropology and MHP Historic Preservation; 21 years' experience	Section 106 Coordination; Historic and Cultural Resources Analysis
Lucila DeRosier	Planner; BS Evolution and Ecology; 11 years' experience	Noise and Vibration Analysis

Name	Qualifications	Primary Responsibilities
Benjamin Harber, AIA, LEED AP BD+C	Architectural Project Manager; BS and MS Architecture; Licensed Architect; 17 years' experience	Visual and Aesthetic Conditions Analysis, prepared visualizations, station concepts, and planning
Claudia Krug Lea, PE	Water Resources Engineer; BS and MS Environmental Engineering; PE; 11 years' experience	Project Coordinator, Public Involvement, Water and Wetlands Analyses
Christopher Martel, PE, LEED AP	Vice President; BS Civil Engineering and MS Environmental Engineering; LEED AP, PE, BCEE; 21 years' experience	Hazardous Materials QA/QC
Jenifer Palmer, AICP	Planner; BA Humanities and Critical Theory, MS Public Administration; Masters Certificate in Urban and Regional Planning; AICP; 8 years' experience	Section 4(f), QA/QC
Sohee Procek, PE	Planner; BS and MS Civil Engineering; PE; 11 years' experience	Traffic Analysis
Jeff Sangillo	Transportation Planner; BS in Operations & Logistics MS Transportation Policy; 10 years' experience	Land Use and Displacements, QA/QC
Greg Saur, PE, PTOE	Transportation Planner/Traffic Engineer; BS and MS Civil Engineering; PE, PTOE; 13 years' experience	Traffic and Transit Analyses
Michael Schultz, GISP, CFM	GIS Specialist, BS and MS Geography; 11 years' experience	GIS Analysis
Kate Stenberg, PhD	Senior Environmental Scientist; PhD Wildlife Science & Planning; MA Environmental Administration; BA Biology-Environmental Studies; 32 years' experience	Threatened and Endangered Species, Vegetation and Wildlife Habitat, Water Resources, Wetlands Analyses

Wight & Company

Name	Qualifications	Primary Responsibilities
Jacob Hohl, PE, LEED AP BD+C	Senior Civil Engineer, MS Civil Engineering, 7 years' experience	Conceptual Engineering
Robin Martel, LEED AP BD+C	Senior Project Manager; BS Geological Sciences; LEED AP BD+C; 22 years' experience	Conceptual Engineering, Draft EIS, Description of Construction, Cumulative, Geology and Soils, Floodplains, Transportation, and Visual Analyses
Peter H. Mesha, PE, LEED AP	President, Transportation Group; BS Civil Engineering; PE, LEED AP; 37 years' experience	Quality Control for Energy, Transportation
Nicole Rogers, LEED AP BD+C	Project Designer, Master of Architecture, 10 years' experience	Prepared visualizations, Visual Analyses

Name	Qualifications	Primary Responsibilities
Thomas W. Williams, PE	Senior Project Manager for Transit Planning; BS Civil Engineering; PE; 36 years' experience	Conceptual Engineering, Energy Analyses

Jacobs

Name	Qualifications	Primary Responsibilities
Joe Clemens, AICP	Senior Transit Planner; Master of City and Regional Planning; AICP; 15 years' experience	Purpose and Need
Mark D. Rinnan, AICP	Transportation Planner; BS Civil Engineering; AICP; 35 years' experience	Safety and Security, Parklands and Community Facilities, Neighborhood and Community Impacts Analyses
Emily Ritzler, AICP	Senior Transportation and Environmental Planner; BA Geography and MS Urban Policy Studies; AICP; 14 years' experience	Environmental Justice Analysis, Noise and Air Quality Documentation
Pat Smeeton	Senior Transportation Planner; BS Civil Engineering; 20 years' experience	Air Quality Analysis
Tom Underwood	Planner; BS Sociology, MS Environmental Science, MBA; 22 years' experience	Construction Impacts and Purpose and Need Analysis
Leonard Voellinger, AICP	Environmental Project Manager; MA Geography; AICP; 37 years' experience	Quality Control for Construction Impacts, Parks, Environmental Justice
John Wirtz, PE, PTOE	Transportation Engineer/Planner; BS and MS Civil Engineering; PE, PTOE; 10 years' experience	Safety and Security Analysis, Track Right-of-Way Protection
Jennifer Zankowski	Environmental Planner; MS Community and Regional Planning; 9 years' experience	Parklands and Community Facilities and Environmental Justice Analyses

KM Chng Environmental, Inc.

Name	Qualifications	Primary Responsibilities
Alan Goldman, QEP	Principal Air Quality Consultant; BS Meteorology; QEP; 30 years' experience	Air Quality Analysis
Richard Letty	Senior Noise and Vibration Consultant; BS Engineering Physics and MS Aeronautics and Astronautics; 42 years' experience	Noise and Vibration Analysis

Midwest Archaeological Research Services, Inc.

Name	Qualifications	Primary Responsibilities
M. Catherine Bird, PhD	Principal Investigator and Research Coordinator; PhD Anthropology; RPA; 32 years' experience	Historic and Cultural Resources Analysis
Jean Guarino	Architectural Historian; MA Art History; 17 years' experience	Historic and Cultural Resources Analysis

DLZ (Formerly Regina Webster & Associates, Inc.)

Name	Qualifications	Primary Responsibilities
Regina Webster, PE, PTOE	Principal; BS Civil Engineering; PE, PTOE; 38 years' experience	Traffic Data Collection
Surekha Lingala	Data Collection Manager; BS and MS Civil Engineering; 12 years' experience	Traffic Data Collection

HDR - Sharon Greene + Associates

Name	Qualifications	Primary Responsibilities
Sharon Greene	Senior Vice President/Director Finance Market Sector; BA English and Economics and MCP Urban and Regional Planning; 40 years' experience	Project Funding and Finance
Eric Rouse	Principal Consultant - Project Finance; BS Political Science and MS Community and Regional Planning; 20 years' experience	Project Funding and Finance
Adam Christian	Senior Consultant - Project Finance; BA Literature and MA Urban Planning; 7 years' experience	Project Funding and Finance

Gearbox Partners

Name	Qualifications	Primary Responsibilities
Sarah Layton Wallace	Strategic Communications and NEPA Public Involvement Expert; BA English; 28 years' experience	Public Involvement

Kathy Schaeffer and Associates, Inc.

Name	Qualifications	Primary Responsibilities
Kathy Schaeffer	Communications and Public Relations Professional; BA Journalism; 30 years' experience	Public Involvement
Kim Pool	Communications and Public Relations Professional; Certificate, Accounting and Business Communications; 15 years' experience	Public Involvement
Jennifer Pennock	Communications and Government Affairs Professional; MS, Public Services Management; 20 years' experience	Public Involvement
Hannah Vander Laan	Administrative and Communications Professional; BA Economics and Political Science; 1 year experience	Public Involvement

Trinal, Inc.

Name	Qualifications	Primary Responsibilities
Alicia Garcia-Abner	President; Masters in Health Care Administration, BS Public Affairs; Master Compliance Administrator; 22 years' experience	Public Involvement
Ularsee Manar	Community Outreach Director; BA Sociology and Masters in Social Work; 37 years' experience	Public Involvement

Curalium Consulting

Name	Qualifications	Primary Responsibilities
Coral Cavanagh, AICP	Environmental Engineer/Planner; BS Civil Engineering and Masters in City Planning; AICP; 27 years' experience	Technical Editor

Hey and Associates, Inc.

Name	Qualifications	Primary Responsibilities
Vincent J. Mosca	Principal Ecologist; BS Biophysical Environmental Studies; CWS Lake and McHenry County, QWRS Kane County; 25 years’ experience	Wetlands Delineation and Analysis
Jeffrey L. Mengler, PWS	Senior Project Scientist, Ecologist; BS and MS Biological Sciences; Professional Wetland Scientist, CWS Lake and McHenry County, QWRS Kane County; 30 years’ experience	Wetlands Delineation and Analysis
Steven J. Rauch	Environmental Services Manager; BA Environmental Studies; CWS Lake and McHenry County, QWRS Kane County; 16 years’ experience	Wetlands Delineation and Analysis

Chapter 14
List of Recipients

In order to facilitate review and comment, the following agencies, local officials, and public libraries were notified of the availability of this document. All agencies and organizations on this list will receive web links to download the Draft EIS from the CTA website.

Agencies, organizations, and libraries that received hard copies of the Draft EIS to make available to the public are identified with an asterisk (*).

Participating agencies are federal, state, or local agencies, or federally recognized Indian tribal governmental units that may have an interest in the proposed project and have accepted an invitation to be a participating agency, or in the case of a federal agency, has not declined the invitation. Participating agencies are identified in **bold** text. All federal, state, local, and regional agencies and tribes are potential participating agencies; all others on the list are not eligible to be participating agencies.

The Federal Highway Administration is a cooperating agency.

Federal Agencies

Advisory Council on Historic Preservation
Transportation Security Administration
U.S. Department of Energy
U.S. Department of the Interior, Office of Environmental Policy and Compliance*
U.S. Department of Health and Human Services
U.S. Department of Housing and Urban Development
U.S. Department of Transportation
  Federal Highway Administration
  Federal Railroad Administration
U.S. Environmental Protection Agency
U.S. Federal Emergency Management Agency
U.S. Fish and Wildlife Service

Tribes

Citizen Potawatomi Nation
Forest County Potawatomi Nation
Ho-Chunk Nation
Miami Tribe of Oklahoma
Peoria Tribe of Indians of Oklahoma
Pokagon Band of Potawatomi Indians
Potawatomi Nation-Hannahville Indian Community
Prairie Band of Potawatomi Nation

Sac and Fox Nation of Mississippi in Iowa
Sac and Fox Nation of Missouri
Sac and Fox Nation of Oklahoma

State Agencies

Illinois Commerce Commission
Illinois Department of Commerce and Economic Opportunity
Illinois Department of Employment Security
Illinois Department of Natural Resources
Illinois Department of Revenue
Illinois Department of Transportation
Illinois Environmental Protection Agency
Illinois Historic Preservation Agency
Illinois Secretary of State
Illinois State Archaeological Survey
Illinois State Museum
Illinois State Police
Illinois State Police District Chicago
Illinois Tollway
Landmarks Illinois

Local and Regional Agencies

Chicago Bureau of Convention and Tourism
Chicago Historical Society
Chicago Housing Authority
Chicago Metropolitan Agency for Planning
Chicago Park District
City of Chicago Department of Aviation
City of Chicago Department of Budget and Management
City of Chicago Department of Business Affairs and Consumer Protection
City of Chicago Department of Community Development
City of Chicago Department of Fleet and Facility Management
City of Chicago Department of Planning and Development Historic Preservation Division
City of Chicago Department of Streets and Sanitation Bureau of Street Operations
City of Chicago Department of Transportation
City of Chicago Office of the Mayor
City of Chicago Police Department
Cook County Board of Commissioners
Cook County Department of Revenue
Cook County Highway Department
Cook County Recorder of Deeds & Registrar of Titles

Cook County Sheriff's Office
Metra
Metropolitan Planning Council
Metropolitan Water Reclamation District of Greater Chicago
Pace
Preservation Chicago
Village of Calumet Park

Community Groups

Agape Community Center
Chicago Neighborhood Initiatives
Developing Communities Project, Inc.
Far South Community Development Corporation
Friends of the Parks
Golden Gate Homeowners Association
Greater Roseland Chamber of Commerce
Neighborhood Housing Services of Chicago
People for Community Recovery
Red Line Extension Coalition
Ridge Historical Society
Roseland Business Development Council
Roseland Manor
Rosemoor Community Association
St. Anthony of Padua Parish

Local Libraries

Altgeld Public Library*
Calumet Park Public Library*
Pullman Public Library*
West Pullman Public Library*
Woodson Regional Public Library*
Harold Washington Library Center*

Glossary

The following terms are used in this Draft Environmental Impact Statement.

95th Street Terminal Improvement Project - The 95th Street Terminal is currently the southern terminus (end) of CTA's Red Line. CTA is in the process of rehabilitating the current 95th Street Terminal, which dates from 1969, with an expanded modern facility. The project will bring substantial improvements to a station that serves thousands of customers each day and is a vital part of the South Side.

Aerial Track Structure - The location of a train track structure above the surface of the ground. Can be constructed of concrete and/or steel.

Affected Environment - The physical, biological, social, and economic setting potentially affected by one or more of the alternatives under consideration.

Alternative - One of a number of specific transportation improvement proposals or options.

Alternatives Analysis - Process of assessing the different transportation improvement proposals or options and documenting alternate concepts based on scenario and functional definitions.

Americans with Disabilities Act (ADA) - Federal regulation establishing legal requirements for accessibility for those with disabilities including wheelchair users.

Area of Potential Impact (API)/Area of Potential Effects (APE) - The geographic area within which the project may cause adverse or beneficial impacts or effects.

At-Grade - The location of a structure or transit guideway at the same level as the ground surface.

Block Group - A census block group is a geographical unit used by the United States Census Bureau. Census block groups fall in size between the census tract and the census block. Census blocks are the smallest geographical units for which the Census Bureau publishes sample data.

Bus Rapid Transit (BRT) - BRT is a bus service that provides faster, more efficient, and more reliable service than an ordinary bus line. Often these changes are achieved by making improvements to existing street and traffic infrastructure. High-capacity, uniquely identified buses are typically used.

Chicago Metropolitan Agency for Planning (CMAP) - The metropolitan planning organization for the Chicago region. CMAP has prepared the *GO TO 2040 Comprehensive Regional Plan*, which provides strategies for the regional transportation network.

Chicago Transit Authority (CTA) - The CTA is an independent governmental agency created by state legislation. It operates the nation's second-largest public transportation system and covers the City of Chicago and 35 surrounding suburbs. CTA is the local lead agency on the Red Line Extension Project.

Community Character - An attribute of a geographic area with identifiable characteristics that make it unique.

Community Cohesion - An attribute of a geographic area, where segmentation or division of the area would reduce its desirability to current and future residents.

Community Resources - Locations that serve as focal points or provide community services. These may include landmarks, parks, or community centers.

Construction Staging - A physical location used for the storage of construction-related equipment and materials such as vehicles and stockpiles.

Cumulative Effect - The incremental environmental impact or effect of the project when added to the impacts of other separate past, present, and reasonably foreseeable future actions.

Deck - The surface of a bridge or elevated rail track section.

> **Closed-deck structure** - Tracks that have a solid deck beneath them. Closed-deck structures allow for more effective noise barriers but require more active snow clearance and drainage maintenance.

Displacement - An impact from a project that results in homes or businesses needing to be relocated.

> **Affected Parcel** - A partial or a full parcel that would need to be acquired because of the project.
>
> **Building Displacement** - A structure that would need to be removed (the land occupied by the structure would also be counted as an affected parcel).
>
> **Easement** - Displacement of a publically owned parcel that would include a roadway. CTA would require a use agreement with the public entity.

Effect (as related to historic/cultural) - Refers to alterations in the character or use of historic properties by the alternatives. Used instead of "impacts" (referred to elsewhere in the Draft EIS) because of the unique requirements and terminology for assessing historic resource impacts.

Elevated Track Structure - The location of a structure above the surface of the ground.

Environmental Impact Statement (EIS) - An EIS is a document that evaluates the economic, social, and environmental effects of a major proposed project. The National Environmental Policy Act (NEPA) requires an EIS to be prepared when federal funds are being sought to fund all or part of a project.

Environmental Justice (EJ) - Environmental Justice is the fair treatment and meaningful involvement of all people regardless of race, color, national origin, or income with respect to transportation planning and decision-making processes, per Executive Order 12898.

Federal Transit Administration (FTA) - FTA is a division of the U.S. Department of Transportation that funds transit planning and programs. FTA is the federal lead agency on the RLE Project.

Fixing America's Surface Transportation (FAST) Act - A funding and authorization bill to govern the United States federal surface transportation spending. Congress passed the FAST Act on December 3, 2015, and President Barack Obama signed it into law on December 4, 2015. The $305-billion, 5-year (FY 2016–FY 2020) provides a steady and predictable funding source over the next five years and an increase of approximately $1 billion per year to the transit program. A number of provisions are provided in the law to assist transit service providers in expediting project delivery, enhancing transit agency partnerships, and targeting investments for state of good repair and bus fleet improvements.

Greenhouse Gas (GHG) - A gas in an atmosphere that absorbs and emits radiation within the thermal infrared range. The primary greenhouse gases in the Earth's atmosphere are water vapor, carbon dioxide, methane, nitrous oxide, and ozone.

Ground-borne Vibration - A technical term used to describe mostly man-made vibrations of the ground. Examples include vibrations caused by trains, buses on rough roads, and construction activities.

Ground-borne Noise - A technical term used to describe mostly man-made noise of the ground. Examples include noise caused by trains, buses on rough roads, and construction activities. Ground-borne noise often sounds like a rumbling.

Hazardous Material - Substances that could harm human health or the environment, including petroleum products, polynuclear aromatic hydrocarbons, pesticides, organic compounds, heavy metals, asbestos-containing materials, lead-based paint, or other compounds.

Headway - The elapsed time between trains passing a fixed point in the same direction over the same track. Refers to train frequency, for example, a 15-minute headway means a train comes every 15 minutes.

Heavy Rail - A railway powered by electricity or diesel fuel with the capacity for a heavy volume of traffic (number of trains and passenger capacity). It is characterized by high speed and rapid-acceleration passenger rail cars operating singly or in multi-car trains on fixed rails, separate rights-of-way from which some other vehicular and foot traffic are excluded, sophisticated signaling, and high-platform loading.

Historic District - A group of buildings, properties, structures, or sites that have been designated either federally or by the City as historically or architecturally significant. Districts vary greatly in size: some have hundreds of structures while others have just a few.

Impact - An impact is a change in the condition or function of an environmental resource that occurs as a result of the proposed alternative. An impact can be adverse (negative) or beneficial (positive).

Adverse Impact - An adverse impact is a negative consequence of the proposed alternative (opposite of a benefit).

Construction Impact - Construction impacts are related to the construction phase of the proposed alternative.

Cumulative Impact - The environmental impact or effect of the project when added to the impacts of other separate past, present, and reasonably foreseeable future actions.

***De Minimis* Impact** - A term from Latin, meaning "about minimal things." A de minimis impact finding is defined in 23 Code of Federal Regulations § 774.17 for historic resources, parks, recreation areas, and wildlife/waterfowl refuges in determinations of use of such resources for environmental analysis.

Indirect Impact - Also known as a secondary impact, indirect impacts are those caused by the project or plan but that are separated from direct impacts by time and/or distance.

Permanent Impact - Permanent impacts are related to the operation (long-term) of the proposed alternative.

Lead Agency - The agency or agencies responsible for preparing the Environmental Impact Statement (EIS) in compliance with the National Environmental Policy Act (NEPA). FTA and CTA are the lead agencies for the RLE Project.

Level of Service (LOS) - A rating that uses a set of characteristics that indicate the quality and quantity of transportation service. Often LOS is defined by the amount of delay at a traffic signal.

Locally Preferred Alternative - The Union Pacific Railroad (UPRR) Rail Alternative was selected by the Chicago Transit Board as the LPA on August 12, 2009, indicating that it is the alternative that best meets the purpose and need of the project while addressing potential impacts and other potential constraints.

Median Household Income - Median household income is a statistical measurement of a set of household income data. The Median household income for a set of data splits the income distribution into two equal groups, half having income above that amount and half having income below that amount. Median household income is typically presented for a defined geographic area.

Mitigation - Action or measure taken to minimize, reduce, eliminate, or rectify the adverse impacts of a project, practice, action, or activity.

Mixed-use - Refers to a mixture of different types of uses in the same structure or location, for example, a building with commercial units on the ground floor and residential units above.

Mobility - The movement of people or goods, including transportation options, travel patterns, access to jobs, and access for emergency service providers.

Moving Ahead for Progress in the 21st Century Act (MAP-21) - A funding and authorization bill to govern the United States federal surface transportation spending. Congress passed MAP-21 on June 29, 2012, and President Barack Obama signed it on July 6, 2012. The $105-billion, 2-year bill did not substantially alter total funding from the previous authorization, but it did include many major reforms.

National Environmental Policy Act of 1969 (NEPA) - Requires all agencies to examine and disclose the environmental impacts of their actions, incorporate environmental information into project decisions, and use public participation in the planning and implementation of all actions.

National Historic Preservation Act of 1966 (NHPA) - Established a national framework for historic preservation, requiring the federal government to establish a national system for identifying, evaluating, protecting, and rehabilitating historic places.

National Register of Historic Places (NRHP) - The national list of districts, sites, buildings, structures, and objects significant in American history, architecture, archaeology, engineering, or culture. It is maintained by the Secretary of the Interior under authority of Section 101(2)(1)(a) of the National Historic Preservation Act, as amended.

NEPA Preferred Alternative - An alternative determined by FTA and the project sponsor (in this case, CTA) to best accomplish the purpose and need of a proposed action while fulfilling statutory requirements and responsibilities, with consideration to economic, environmental, technical, and other factors. In August 2014, based on the technical analysis and public input received, CTA announced the NEPA Preferred Alternative for the RLE Project—the UPRR Rail Alternative. The NEPA Preferred Alternative is the RLE Project alternative that is studied in the Draft EIS. CTA intends to move forward with the NEPA Preferred Alternative into the next stage of project development.

New Starts - FTA’s primary grant program for funding major transit capital investments, including rapid rail, light rail, bus rapid transit, commuter rail, and ferries.

No Build Alternative - The No Build Alternative refers to an alternative under which no action would be taken (no infrastructure would be built and no new management or operational practices would be instituted). The No Build Alternative includes all projects currently included in the fiscally constrained portion of the CMAP Fiscal Year 2010–2015 Transportation Improvement Program (TIP), including renovation of the 95th Street Terminal.

Noise Barrier - An exterior structure located next to the tracks that is designed to protect surrounding residents and community members from noise impacts related to the proposed project. Noise barriers are an effective method of mitigating roadway, railway, and industrial noise sources.

Noise-Sensitive Receiver - Noise-sensitive receivers are residences and/or other land uses that would be negatively affected by noise from the proposed project, such as tracts of land set aside for serenity and quiet, hospitals, hotels, churches, museums, parks, and cemeteries.

Nonattainment Area - Nonattainment areas are metropolitan areas that do not meet national ambient air quality standards (NAAQS), ranked by the severity of their problem as marginal, moderate, serious, severe, or extreme. In accordance with the Clean Air Act Amendments of 1990, these areas must take specific emission reduction measures.

Option - One of the several possibilities for an alternative. The UPRR Alternative has two options: the East Option and the West Option, each along the same general alignment but slightly different.

Peak/Off-Peak - Peak is the AM or PM time period when the largest volume of riders occurs. Off-Peak is the remainder of the day when travel activity is generally lower.

Photo Simulation - A computer-generated image that shows how an alternative, station, or feature could look after construction.

Platform - An area at a station used to get on or off trains.

Public Participation Plan (PPP) - A Public Participation Plan includes public outreach goals, key issues, a detailed stakeholder database, communications protocols, public input tracking protocols, a proposed schedule for interfacing with the public, and recommendations for how meetings should be conducted at various stages of the study.

Purpose and Need - Identifies the reasons a proposed project is needed and reflects the project objectives discussed with the public during the scoping process.

Railroad Ties - Rectangular supports for railroad tracks. Railroad ties are traditionally made of wood.

Record of Decision (ROD) - A document prepared by FTA that presents the basis for selecting and approving a specific transportation proposal that has been evaluated through the various environmental and engineering studies. Typically, the ROD identifies the alternative selected in the Final EIS, the alternatives considered, measures to minimize harm, monitoring or enforcement programs, and an itemized list of commitments and mitigation measures.

Red Ahead Program - A comprehensive initiative for maintaining, modernizing, and expanding Chicago's most traveled rail line. The program includes major improvement projects on the Red and Purple Lines between Linden terminal in the north and the proposed 130th Street terminal on the south. The improvement projects include the Red and Purple Modernization project, the Red Line Extension Project, and the Red Line South Reconstruction Project. In addition, the Red Ahead Program encompasses several individual projects, including the renovation of several stations along the Red Line including Wilson Station, Clark and Division Stations, and the 95th Street Terminal.

Red Line Extension (RLE) Project - The Chicago Transit Authority (CTA) is proposing to extend the Red Line from the existing 95th Street Terminal to 130th Street, subject to the availability of funding. The proposed 5.3-mile extension would include four new stations near 103rd Street, 111th Street, Michigan Avenue, and 130th Street. Each new station would include bus and parking facilities. This project is one part of the Red Ahead Program to extend and enhance the entire Red Line.

Right-of-Way - In transit usage, the corridor along a railway that is controlled by a transit or transportation agency/authority.

Safe, Accountable, Flexible, Efficient Transportation Equity Act: A Legacy for Users (SAFETEA-LU) - A funding and authorization bill that governed the United States federal surface transportation spending. It was signed into law by President George W. Bush on August 10, 2005, and expired on September 30, 2009. The Moving Ahead for Progress in the 21st Century Act (MAP-21) replaced this law on July 6, 2012.

Safety - Safety refers to freedom from harm resulting from unintentional acts or circumstances. With regard to the RLE Project, safety includes all possible incidents within the CTA right-of-way (which includes areas along tracks, in yards, and at stations). Examples include collisions, derailments, fires, property damage, injuries, and fatalities.

Scoping - An early and open process for identifying the extent, variety, and significance of issues related to a proposed action in the EIS. Scoping for RLE was held in the form of public open house meetings in the fall of 2009.

Secondary Station Entrance/Exit - An auxiliary entry/exit in addition to the primary entry and/or exit.

Section 4(f) - Section 4(f) of the Department of Transportation Act of 1966 states that no transportation project should be approved that requires the use of land from a public park, recreation area, wildlife and waterfowl refuge, or historic site unless there is no feasible or prudent alternative to the use of such land or the use of such land are found to be *de minimis*.

Section 106 - Section 106 of the National Historic Preservation Act deals with project effects on historic properties. It requires consultation with parties with expertise and interest in historic resources.

Security - Security refers to freedom from harm resulting from intentional acts or circumstances. Intentional danger includes crimes and must be reported if the intentional act meets thresholds for notification as specified in FTA's State Safety Oversight Rule.

Sensitive Receiver Cluster - A group of noise-sensitive receivers determined to be at similar distances from the proposed track locations and where the CTA operating conditions, such as train speed, would be similar.

Shoring - The process of supporting a structure in order to prevent collapse so that construction can proceed.

State Historic Preservation Officer (SHPO) - The official appointed or designated pursuant to Section 101(b)(1) of the National Historic Preservation Act to administer the State historic preservation program. The SHPO consults with state and federal agencies during the Section 106 process review. The SHPO administers the national historic preservation program at the State level, reviews National Register nominations, and maintains file data on historic properties that have been identified but not yet nominated. Agencies seek the view of the SHPO in the identification of historic properties and the assessment of the effects of a project on historic properties.

Substation - A part of an electrical generation, transmission, and distribution system. Substations transform voltage from high to low, or the reverse, or perform any of several other important functions.

Transit Infrastructure - Basic physical elements of the transit system including track, structures, signals, and power.

Transportation Improvement Program (TIP) - A document prepared by metropolitan planning organizations listing projects to be funded with Federal Highway Administration and FTA funds for the next 1- to 3-year period.

Transportation System Management - A “low cost” project alternative that was previously required for FTA analyses.

Transit-Oriented Development (TOD) - TOD is development that takes advantage of the location of the site adjacent to or near a transit station. TOD includes mixed-use developments, such as residential buildings with ground-floor retail that complement and take advantage of adjacent transit stations, activate streetscapes, enhance livability, and encourage economic development.

Travel Time - The time spent traveling from a place of origin to a place of destination.

Uniform Act - The Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970, as amended, mandates that relocation services and payments be made available to eligible residents, businesses, and nonprofit organizations displaced as a direct result of projects undertaken by a federal agency or with federal financial assistance.

Union Pacific Railroad (UPRR) - The UPRR owns and operates tracks and trains that run through the project corridor along Eggleston Avenue.

Viaduct - A bridge-like structure over a street that allows trains to pass over the street and vehicles to pass under the tracks.

Viewshed - An area that is visible to the human eye from a fixed vantage point.

Visual Impact - A change in the appearance of a place as a result of development. Visual impacts can be positive or negative.

Wetland - Land where saturation with water is the dominant factor determining the nature of soil development and the types of plant and animal communities living in the soil and on its surface.

Yard and Shop - An area in a rail system used for maintenance, storing, or holding trains.

1.0 INTRODUCTION

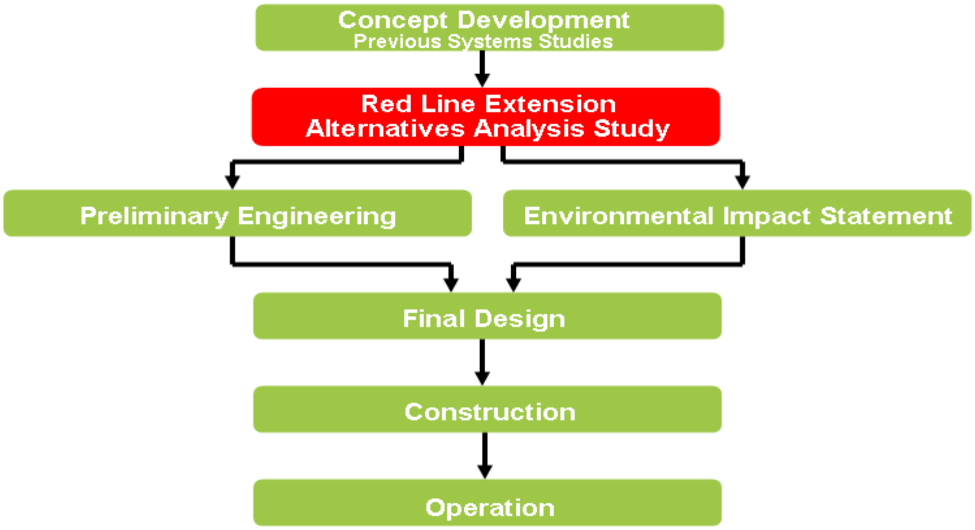
1.1 Context of the Alternatives Analysis

The Chicago Transit Authority (CTA) Red Line Dan Ryan rapid transit branch opened for service in September 1969. Proposed extensions of the CTA Red Line Dan Ryan branch to the south from its current terminus at 95th Street have been consistently included in the Chicago region's long range transportation plan developed by the Chicago Metropolitan Agency for Planning (CMAP), formerly the Chicago Area Transportation Study (CATS), since the mid-1970s.

The Chicago Department of Transportation (CDOT) also completed a draft feasibility study of transportation needs for the Far South area of the City of Chicago that concluded that despite strong transit ridership, access to CTA transit services was challenging. This draft feasibility study examined several transit corridors for their potential to improve mobility for Far South area residents and businesses. This feasibility study was also intended to lay the ground work for an Alternatives Analysis (AA) study to formally identify a Locally Preferred Alternative (LPA).

In late 2006, the CTA initiated an AA study to identify and evaluate potential major fixed guideway transit solutions in the Far South area of Chicago. This AA report documents the identification, evaluation, and selection of a LPA for the CTA, consistent with the planning and project development process defined by the Federal Transit Administration (FTA). The Alternatives Analysis is the first major step in the FTA New Starts process (shown in Figure 1.1). Transit agencies across the country seeking federal New Starts funding must follow this process. The CTA used the results of past studies as a starting point for conduct of the AA study. The AA study is completed with the selection of a LPA.

Figure 1.1: FTA's New Starts Process



The next steps in the process are Preliminary Engineering (PE) and the preparation of an Environmental Impact Statement (EIS). The CTA must apply to FTA for entry into Preliminary Engineering. If the LPA from the AA study meets the New Starts criteria thresholds established by FTA for transit projects nationally, then permission can be granted to begin PE. PE consists of more detailed design and costing of the LPA to a much higher degree of confidence. At the same time, an EIS is also prepared to evaluate all potential environmental impacts, as required by the National Environmental Policy Act (NEPA).

Final Design is the last phase of project development, and includes right-of-way acquisition, utility relocation, and the preparation of final construction plans for the LPA. Assuming all funding is in place, and the FTA issues a Full Funding Grant Agreement, construction can begin. After completion of construction and testing, the new transit service can begin operation.

Each of these steps in the New Starts process typically takes a minimum of two years although PE and preparation of an EIS can be completed concurrently. Public involvement is integral to each steps. For the AA study, CTA implemented a public involvement process that included a wide range of stakeholders from the study area, elected officials, agencies, and the general public.

1.2 Purpose of the Alternatives Analysis Report

The purpose of the Red Line Extension AA Study is to identify transit improvements that would provide improved mobility to residents and businesses located in the City of Chicago's Far South Side and surrounding suburbs. The report summarizes the results of an AA that followed FTA New Starts project development guidance. It provides information on the costs, benefits, and impacts of a wide range of alternatives that went through a three step screening process. The result of the Red Line Extension AA is a LPA that was adopted by the Chicago Transit Board.

1.3 Organization of this Report

This report is organized into eight sections. Section 2 describes the purpose and need of the project, including a description of the study area and the existing transportation system, planned growth and improvements in the study area, the need for an improved transit system. Section 3 describes the Screen 1 Evaluation of the Universe of Alternatives. Section 4 describes the Screen 2 Evaluation of the alternatives carried forward from Screen 1. Section 5 describes the Screen 3 Evaluation and the recommendation of a LPA. Section 6 describes the Locally Preferred Alternative (LPA) and how well the LPA achieved the project goals and objectives. Section 7 provides and overview of public involvement and Section 8 describes the next steps for the project.

2.0 PURPOSE AND NEED

2.1 Description of Study Area

The Chicago metropolitan region has the second largest transit system in the nation. The CTA bus and heavy rail system provides service to the City of Chicago and 40 suburbs. The CTA system served over 520 million trips in 2008. Coordination with Metra commuter rail, Pace suburban bus service, and private bus operations results in an integrated regional transit system. The region's transportation system -- both transit and highways -- support the economy of the region, provide access to jobs and other personal and business travel needs, and support development throughout the study area and region.

There are concentrations of established communities where accessibility to CTA rapid transit services is more challenging. The Far South area of Chicago is has high transit ridership, but access to the existing rapid transit network is challenging.

Pedestrian and bus congestion is a daily problem at the CTA's Red Line 95th Street station. Limited employment options in the Far South area require residents to travel long distances to the Chicago Central Area or other regional employment centers. The strong dependence on the Red Line to reach these opportunities, coupled with a constrained street network, result in many lengthy bus trips to access the 95th Street Station. According to the 2000 U.S. Census, commute times for the Far South area are longer than the region’s average commute time.

The purpose of the Red Line Extension Alternatives Analysis (AA) Study is to identify transit improvements that would provide improved mobility to residents and businesses located in the City of Chicago’s Far South Side and surrounding suburbs.

2.1.1 Study Area Boundaries

The study area (Figure 2.1) is situated 11 miles south of the Chicago Central Area (commonly referred to as the “Loop”) and encompasses approximately 20 square miles. The boundaries of the study area are 95th Street on the north, Ashland Avenue on the west, Stony Island Avenue on the east, and the Calumet-Sag Channel/Little Calumet River and 134th Street on the south. The I-57 Expressway and I-94 Bishop Ford Freeway traverse the western and eastern edges of the study area, respectively. Lake Calumet is located in the eastern portion of the study area.

The study area encompasses parts of nine community areas in the City of Chicago and the eastern section of the City of Calumet Park (area east of Ashland Avenue). Community areas include Washington Heights, Beverly, Morgan Park, Roseland, Pullman, West Pullman, South Deering, Hegewisch and Riverdale (Figure 2.1). The study area has significant residential (primarily single family), industrial (existing and vacant), transportation and commercial development. The study area boundaries are major, recognizable streets, used to clearly define where possible alternatives would be considered. However, travel patterns and analyses beyond the study area are integral components to the project study and included as necessary.

2.1.2 Demographic Characteristics

The six-county northeastern Illinois region is the third most populated metropolitan region in the nation. The City of Chicago, with 2.9 million residents, is the nation's third largest municipality. In 2000, the study area had over 133,000 residents living in nearly 42,000 households. Study area population is expected to grow by 5 percent and households by 9 percent between 2000 and 2030.

Table 2.1: 2000 and 2030 Population

Area	2000 Population	2030 Population	Growth	2000 Households	2030 Households	Growth
Six-County NE Illinois Region	8,092,145	10,050,860	+24%	2,907,201	3,636,108	+25%
City of Chicago	2,897,715	3,261,464	+13%	1,062,683	1,222,082	+15%
Red Line Ext. Study Area	133,364	139,820	+5%	41,515	45,349	+9%

Source: Northeastern Illinois Planning Commission (now CMAP) 2030 Forecasts, approved 9/27/2006.

As seen in Figure 2.2, population density in the study area generally ranges from 5,000 to 20,000 persons per square mile and is consistent with the population density around the existing CTA Red Line service.

The study area population is almost entirely minority. In 2000, 93.8 percent of the study area population was African American (see Figure 2.3), 2.7 percent Hispanic, 1.9 percent Caucasian, and 1.6 percent other minorities.

A large share of the study area population is low income, as shown in Figure 2.4. In 2000, 21 percent of the population had incomes below the poverty level – double the population of low income residents in Cook County, at 11.5 percent. Just south of 130th Street and to the west of the I-94 Bishop Ford Freeway, 3,400 residents live in the Altgeld Gardens/Murray Homes public housing development.

2.1.3 Employment and Economic Development

The Far South area of Chicago has seen many of its major employment centers close since the 1980s, with a loss of around 20,000 jobs. Despite these losses, the area has remained an active industrial center in the region. Since the late 1990s employment has been increasing. Several Far South area businesses have expanded, including the Ford Motor Company in South Deering, offsetting some of the job losses from previous years. As shown in Table 2.2, the 2000 employment in the Red Line Extension study area is approximately 17,000 jobs, with CMAP 2030 employment projections at 27,000 jobs (58 percent increase).

Area	2000 Employment	2030 Employment	2000-2030 Change
Six-County NE Illinois Region	4,297,686	5,535,236	+29%
City of Chicago	1,499,255	1,745,101	16%
Red Line Study Area	17,290	27,108	58%

Source: Northeastern Illinois Planning Commission (now CMAP) 2030 Forecasts, approved 9/27/2006.

In 2000, the Far South study area had one job for every eight residents. This compares to one job for every two residents for the City of Chicago and the six-county northeastern Illinois region as a whole. As a result, many residents must travel to downtown Chicago or other major employment centers for work, resulting in long commutes for many Far South residents. By 2030, the jobs to population balance is expected to improve for the study area to one job for every five residents, but will still remain far below the city and regional averages.

The City of Chicago is focusing on stabilizing, improving and redeveloping communities in the Far South area. The City has designated several Tax Increment Finance (TIF) districts, Redevelopment Areas (RA), and Industrial Corridors in the study area. TIF districts direct future tax revenue increases back to the district for development assistance, infrastructure improvements, environmental remediation, building demolition, land acquisition, and employment training. RAs allow for building acquisition and demolition, assembling lots into viable parcels, and improving community facilities, infrastructure, and transportation facilities. Industrial Corridors are designated to improve opportunities for manufacturers and other industrial users. Major incentive zone areas in the study area include the 119th/Halsted RA, the Roseland/Michigan Avenue RA, the Pullman Industrial Corridor, and several smaller TIF districts.

There have been numerous market studies[1] performed in the study area to identify economic development opportunities. These studies have recommended:

- increase the supply of sites available to retain growing companies and attract new ones,
- develop large parcels to overcome perceptions of disinvestment,
- assemble large sites near intermodal facilities and market to major regional distributors,
- provide transportation support to TIF development projects,
- create proactive programs to identify and retain companies faced with expansion,
- develop comprehensive labor force development efforts,
- increase presence of commercial services franchises,
- explore potential for back-office development, and
- address unmet retail and grocery store demand.

---

2.1.4 Land Use Characteristics

The study area's land use is diverse, as depicted in Figure 2.5. Approximately 44 percent of the study area is residential and 11 percent industrial. Retail and commercial areas are located north-south along the Halsted Street and Michigan Avenue corridors. Large tracts of vacant or underutilized industrial land remain in the eastern portion of the study area in the vicinity of Lake Calumet.

The study area is rich in educational facilities, including Chicago State University (7,200 students), Olive-Harvey College (4,300 students), and several high schools including Harlan, Corliss, Fenger, Julian, Brooks and Carver.

Other activity centers in the study area include South Michigan Avenue Shopping District, Halsted Street Commercial Corridor, Roseland Hospital (162 beds), Sherwin-Williams, Ryerson, the Illinois International Port District, and Metron Steel. The Ford Motor plant, with 2,800 employees, is located at 130th Street and Torrence Avenue, just east of the study area.

2.1.5 Travel Patterns[2]

More than 282,000 total daily trips originated or were destined to the study area in 2000. By 2030, daily trips are projected to increase by over 26 percent to over 356,000 trips.

Of the total daily study area trips in 2000, approximately 17 percent of these trips were home-based work trips. By 2030, home-based work trips increase 14 percent from 2000.

As seen in Figure 2.6, compared to other districts, the study area (District 1) exhibits a strong tie to the Chicago Central Area (District 7), and other districts accessible by CTA rapid transit, for work trips. Of the 48,000 daily work trips originated or were destined to the study area in 2000, 24.4 percent of these trips were to/from the Chicago Central Area. Other 2000 major work trip flows to/from the study area include the district surrounding the study area (District 2) at 9 percent, the south lakefront (District 16) at 9 percent, the mid-south (District 15) at 7 percent, the west side (District 14) at 6 percent, the internal study area (District 5) at 5 percent, and major employer areas such as northwest Cook County (District 8) and DuPage County (District 20) at 3.4 percent and 2.5 percent respectively.

Of the total study area daily trips in 2000, approximately 71 percent of these trips were home-based other trips. By 2030, home-based other trips increase 30 percent from 2000. Major home-based other trip flows to/from the study area in 2000 include the district surrounding the study area (District 2) at 29 percent, the internal study area (District 1) at 16 percent, the south lakefront (District 16) at 12 percent, the southwest side (District 18) at 9 percent, the mid-south (District 15) at 7 percent, Will County (District 21) at 5 percent, and the Chicago Central Area (District 7) at 4 percent.

Non-home based trips are 12 percent of total trips for the study area in 2000. By 2030, non-home based trips increase 25 percent from 2000. Of the total home-based work trips in 2000 to/from the study area, 9 percent or nearly 4,500 work trips were made by households with zero-car ownership. By 2030, the number of home-based work trips by households with zero-car ownership increases 5 percent to 4,700.

The Far South study area had a 26 percent overall home-based work transit mode share in 2000. In particular, the study area shows very strong transit usage to the Chicago Central Area for these work trips at 57.6 percent in 2000, with the transit mode share projected to increase to 60.3 percent by 2030.

Home-based other transit mode share for the study area is 3.5 percent in 2000. Non-home based transit mode share for the study area is 3 percent in 2000.

2.2 Transportation Facilities and Services

The study area is served by roadway and transit systems, and pedestrian and bicycle facilities. Figure 2.7 depicts the roadway and rail transit systems within the study area, while Figure 2.8 provides additional details for CTA and Pace bus service within the study area.

2.2.1 Roadway System

The study area includes expressways, regional arterials, truck routes, intermodal connectors, secondary arterials and local streets. Expressways within the study area include I-57 and I-94 Dan Ryan/Bishop Ford. Average daily traffic (ADT) on I-94 Bishop Ford ranged from 129,000 west of King Drive to 156,800 north of 130th Street. The ADT on I-57 ranged from 145,900 north of 119th Street and 125,300 north of 127th Street. Leading to downtown Chicago, the I-94 Dan Ryan Expressway is one of the busiest expressways in the nation with an ADT of 300,000.[3]

Lake Calumet and the Calumet River are natural barriers resulting in no through-roads that would connect the eastern and western parts of the study area between 103rd and 130th Streets. Halsted Street is the only through north-south arterial road in the study area that crosses the Calumet-Sag Channel. ADT on Halsted Street is 26,000.

Based on CMAP 2030 traffic forecasts, projected traffic increases for Far South roads were approximately 10 percent for expressways and between 20 to 30 percent for arterials, with east-west travel demand growing slightly higher than north-south travel demand.

2.2.2 Transit System

The CTA's Red Line 95th Street terminal is at the northern boundary of the study area. Average frequency of service (headway) during the peak periods is 5 minutes, and service is provided around the clock, as seen in the Table 2.3 below. Entering weekday passengers at the 95th Street station was 14,240 in April 2008, or an estimated total of 28,500 passengers entering and exiting the station. The 95th Street station is CTA's highest entering station traffic outside of the Loop and is second overall in the system (excluding cross-platform transfers).

Table 2.3: CTA Red Line Service Summary

Service Period	Hours	Time Period	Average Frequency (minutes)	Train Length	Vehicles Required
Weekday					
Early Morning	3.0	03:00 - 06:00	13	4 or 8	
AM Peak	3.0	06:00 - 09:00	5	8	304
Base	6.0	09:00 - 15:00	7	4 or 8	184
PM Peak	3.0	15:00 - 18:00	5	8	304
Evening	4.0	18:00 - 22:00	7.5	4	
Late Evening/Owl	5.0	22:00 - 03:00	15	4 or 2	48
Weekday Total Hours	24.0

No CTA park-and-ride facilities are located on the Red Line Dan Ryan branch. The Red Line Dan Ryan branch and Lake Street branch of the Green Line are the only two rapid transit branches without park-and-ride facilities.

There are currently two yard and shop facilities located on the Red Line; Howard yard and shop at the north terminus of the Red Line, and 98th Street yard and shop at the south end of the line in the study area. Currently, all Red Line cars are operated and maintained from the Howard and 98th Street facilities. In addition, Yellow Line cars are stored and maintained at the Howard Yard and Shop, and the Purple Line cars are operated and maintained at yards and shops at both Linden and Howard. The 98th Street shop facility is now 40 years old, having been constructed in 1969 as part of the Dan Ryan Line construction project. The 98th Street shop is cumbersome for CTA operations due to its constrained location within an expressway median and access to the facility for materials delivery is difficult because of its grade separation from local streets. The CTA has long recognized the 98th Street shop as being an inadequate facility to support the current and future maintenance needs of the south end of the Red Line and have included the need for an expanded or new 98th Street shop in past capital programs although funding for replacement has not yet been identified.

Metra and the Northern Indiana Commuter Transportation District (NICTD) provide commuter rail service in the study area. Metra commuter rail service in the study area includes the Metra Electric District (MED), which has 10 commuter rail stations in the study area. Of the five MED mainline stations, the Kensington/115th Street station is a major transfer station and is served by 19 inbound trains between 6:00 a.m. and 9:00 a.m. on a typical weekday. The Kensington/115th Street station also has park-and-ride facilities with a capacity of 408 cars that is fully utilized. The other MED stations in the study area have much less frequent service. The other four stations (111th Street, 107th Street, 103rd Street, and 95th Street) on the MED main line are served by four or five inbound trains during the morning peak period. The five stations in the study area on the Blue Island branch of the MED (Ashland Avenue, Racine Avenue, West Pullman, Stewart Ridge, and State Street) are served by six inbound trains in the morning peak period.

The Metra-Rock Island District mainline has two stations (Longwood and Washington Heights) within the far northwestern portion of the study area. The NICTD South Shore commuter rail trains serve the study area at the Kensington/115th Street station, picking up southbound only and discharging northbound only.

The Metra commuter rail ridership in the study area is shown in Table 2.4. Of these stations, 115th Street/Kensington has the highest utilization with 1,577 average weekday boardings. Metra has previously considered the consolidation of stations north of Kensington/115th Street station.

CTA and Pace bus services are provided on north-south and east-west thoroughfares in the study area, with 22 CTA bus routes and seven Pace bus routes operating on the edge or within the study area. Of those bus routes, 19 serve the 95th Street terminal station on the Red Line.

As seen in Table 2.5, these bus routes average 12.4 miles in length, 46 minutes in travel time, and 4,989 in daily ridership.

Table 2.5: CTA and Pace Bus Routes Serving 95th Street Station

* Ridership for CTA #95E and #N5 are reported together
** Ridership for CTA #N9 includes ridership for the #9 Ashland

The current transit fare structure for CTA is shown in Table 2.6. Pace regular bus fares are $1.75 with $0.25 transfers. The Pace/CTA 7-day pass is $28.00 and the 30-day pass is $86.00. Metra fares for MED mainline and Rock Island stations in the study area are Zone C fares, which from downtown Chicago are $3.35 (10-ride tickets are $28.50 and monthly tickets are $90.45). Fares for the MED Blue Island branch in the study area are Zone D are $3.80 (10-ride tickets are $32.30 and monthly tickets are $102.60).

Table 2.6: CTA Fare Structure

CTA Fare Types	Fare Structure (Effective 1/1/2009)
Full Fare Cash (Bus only)	$2.25
Full Fare Transit Card (TC) Bus	$2.00
Full Fare TC Rail	$2.25
Full Fare Chicago Card (CC) Bus	$2.00
Full Fare CC Rail	$2.25
TC or CC Transfer[1]	$0.25
1-Day Pass	$5.75
3-Day Pass	$14.00
7-Day Pass CTA only	$23.00
7-Day Pass CTA/Pace	$28.00
Full Fare 30-Day Pass	$86.00
Link-Up Pass	$39.00
Reduced Fare TC or CC	$0.85
Reduced Fare Cash (Bus only)	$1.00
Reduced Fare TC or CC Transfer	$0.15
Reduced Fare 30-Day Pass	$35.00

[1] Transfer fare allows two additional rides within two hours of the first boarding.

2.2.3 Intercity Bus Service

A Greyhound Bus Terminal also exists at the Red Line 95th Street Station. Intercity buses offer connecting services to much of North America. Buses arrive and depart several times per day including direct and/or connecting service nationwide and to nearby locations such as Chicago Union Station, Detroit, Minneapolis, St. Louis, St. Paul, Gary, Indianapolis, Champaign, Rockford, Bloomington, Springfield, Milwaukee, South Bend, and Benton Harbor.

2.3 Performance of the Transportation System

2.3.1 Agencies Involved in Transportation Planning

The Policy Committee of the Chicago Metropolitan Agency for Planning (CMAP) is the designated Metropolitan Planning Organization for the northeastern Illinois region. CMAP was formed in 2005 by combining the region's two previously separate transportation and land-use planning organizations – the Chicago Area Transportation Study (CATS) and the Northeastern Illinois Planning Commission (NIPC) -- into a single agency.

The Regional Transportation Authority (RTA) is a fiscal oversight agency responsible for three operating agencies or “service boards”-- CTA, Metra, and Pace. Other agencies, such as the Chicago Department of Transportation, the Illinois Department of Transportation, and the Cook County Highway Department have transportation planning responsibilities in the study area.

2.3.2 Local Transportation Goals and Objectives

The current CMAP 2030 Regional Transportation Plan, adopted in October 2008, contains three overarching goals: maintain the integrity of the existing transportation system, improve transportation system performance, and employ transportation to sustain the region’s vision and values. Relevant objectives include:

Transportation mobility and accessibility objectives

Promote transportation proposals that:

- increase access to job opportunities
- provide efficient modal alternatives for short trips
- reduce traffic congestion

Transportation system efficiency objectives

Promote transportation proposals that:

- reduce highway congestion
- increase the availability of public transit
- supports regional or local efforts to balance the location of jobs, services, and housing to reduce travel distances

Congestion management objectives

Promote transportation proposals that:

- reduce highway congestion
- improve system reliability
- increase person throughput capacity in congested corridors by increasing vehicle occupancy, providing transit options, and encouraging transit use
- increase the share of trips made by walking, bicycling, and transit
- improve coordination and connectivity between and among different modes
- support regional or local efforts to balance the location of jobs, services, and housing to reduce travel distances

Transportation and social equity objectives

Promote transportation projects that:

- provide improved transportation choices to economically disadvantaged persons
- stimulate balanced and sustainable development in communities with concentrations of disadvantaged residents
- support programs providing financial incentives to low-income persons residing in communities that provide a wider variety of transportation choices
- support links from disadvantaged communities to jobs and services

2.3.3 Roadway System Performance

Roadway system capacity deficiencies and expressway and arterial traffic congestion limit the mobility and accessibility of the residents of the study area. Traffic congestion in the metropolitan area has steadily grown over the past decades along the region’s expressways and major arterials. Chicago is ranked as second in the nation for travel time ratio (peak travel times versus free flow travel time), third for travel delay, excess fuel consumed, and congestion costs, and is ranked fourth for congestion, with 72 percent of its freeway and street lane-miles congested.[4]

The 2000 Census reported that commute times were longer for study area residents than for Chicago as a whole. In 2000, the Chicago's average commute time was 34.4 minutes, while commute times for residents on the study area averaged 41.6 minutes—21 percent higher, as shown in Figure 2.9.

Significant expressway and arterial street traffic congestion occurs throughout the study area. As seen in Figures 2.10 and 2.11, the roadway network is approaching capacity during the morning peak periods in 2000 and is expected to worsen by 2030. As seen in these figures, almost every expressway segment has a volume-capacity ratio approaching or exceeding one. Arterial street traffic shows approximately half of the street segments in the study area have volume-capacity ratios greater than one.

Arterial street reliability is further compromised by delays from at-grade freight railroad crossings in the study area. The Union Pacific Railroad (UPRR) – which operates approximately 27 trains per day through the study area – has at-grade crossings at several east-west arterials in the study area. Similarly, there are shorter delays for the Metra Electric District Blue Island Branch commuter trains that operate at-grade and cross several major arterials in the study area.

With the I-94 and I-57 expressways in the study area already congested with trips starting south of the study area already approaching or exceeding the expressway capacity. Study area generated traffic on the expressways exacerbates this situation.

2.3.4 Transit Performance

Red Line 95th Street Station

The 95th Street bus terminal is situated over the Dan Ryan Expressway and serves the 95th Street rail station, the southern terminus of the Red Line. The area surrounding 95th Street terminal is congested due to the high number of vehicles entering and leaving the Dan Ryan Expressway. In addition, the street network in the area is characterized by a lack of through streets over the expressway and residential streets which are not appropriate for bus traffic. Buses serving the 95th Street Station must use the terminal to change direction because the existing street network is not conducive to on-street turnaround operations.

A review of current bus schedules indicates that speeds decrease dramatically within one mile of the terminal. Speeds on select bus routes are shown in Table 2.7.

Table 2.7: Speeds for Selected Bus Routes Serving 95th Street Terminal

Bus Route	Scheduled Operating Speed	
	< 1 mile from Terminal	> 1 mile from Terminal
34	9.65	12.0
95W	8.25	11.5
95E	8.6	11.25
108	8.6	12.0
106	7.1	11.3

Source: CTA Bus Supervisor Guide Weekday, effective Dec. 28, 2009
Bus routes were selected if they had a scheduled time point approximately one mile from the terminal.

These speeds indicate that transit customers destined for 95th Street bus terminal and the Red Line experience delays on a daily basis.

The bus terminal, shown in Figure 2.12, contains nine bus islands surrounding the rail station entrance. Seven bus islands can accommodate two buses at a time, while two bus islands can accommodate three buses, for a total of 20 bus bays. Four islands are located on each side of the station (east and west) while a sidewalk located on the north side of the station functions as an additional bus island. Driveways are located off of 95th Street, Lafayette Avenue and State Street. Lafayette Avenue is one-way southbound and State Street is one-way northbound. Because Lafayetts and State Streets operate in only one direction, these driveways are of limited utility and are used exclusively by bus route 29 State Street.

All buses, except route 29, enter the terminal from 95th Street. Operations in the terminal are one-way clockwise with buses entering the west driveway in a northbound direction, circling the north side of the station and traversing the east side of the terminal southbound. Buses exit the terminal onto 95th from the east driveway. Circulation within the terminal is slow due to tight turns and the frequent presence of pedestrians in the driveways.

Normal CTA terminal operation involves the use of a passenger drop off area at a sidewalk adjacent and convenient to the station entrance. The bus then proceeds to an assigned bus bay to collect boarding customers and take scheduled recovery time. CTA cannot follow normal procedures at 95th terminal because space for a drop off area is unavailable. A drop off area is approximately the size of three to five bus bays. All available bus bays at 95th terminal are assigned to one or more bus routes.

---

[5] CTA 95th Station Expansion Study, July 1992

Bus routes assigned to bus bays in the west and north terminals drop off and pick up customers at the same location. This creates pedestrian congestion at the bus stop as disembarking passengers conflict with waiting customers on the curb. Bus routes assigned to the east terminal currently drop off passengers in the through lane in the west terminal. Dropping off passengers in the through lane of the west terminal will occasionally prevent buses from entering the terminal and cause following buses to queue along 95th Street waiting to enter the terminal.

Current operations within the bus terminal are not ideal or desirable, but are required due to the number of bus routes that must access the terminal. Nineteen CTA and Pace bus routes utilize the 95th Street terminal. Of these, two CTA routes (N5 and N9) and two Pace routes (395 and 1012) operate infrequently or during overnight hours and do not require a bus bay in peak periods. In addition to CTA and Pace, Greyhound Bus Lines occupy a bus bay in the terminal. Thus, a total of 16 bus routes require at least one bus bay during the morning peak. Eleven of the 16 bus routes require two bus bays because two buses are scheduled in the terminal at the same time. A minimum of 27 bus bays are required to accommodate current schedules. Since the 95th Street terminal contains only 20 bus bays, the terminal is operating over capacity.

In addition to the twenty-seven bays needed to accommodate current schedules, an additional five bays would be required for a drop off area at the terminal consistent with CTA standard operation elsewhere. The lack of a drop off area slows passenger boarding and alighting, creates congestion at the bus bays, and causes buses to back up onto 95th Street. Implementing a drop off area in the terminal increases the number of additional bays required to 12 (32 total bus bays).

A need exists to expand the 95th Street bus terminal in order to accommodate current schedules and comply with standard operating procedures. A terminal expansion would improve bus travel time entering the terminal, decrease transfer time within the terminal, and improve safety.

Bus Performance

Thirteen CTA and six Pace bus routes serve the 95th/Dan Ryan Red Line station. During an average weekday, approximately 6,600 riders (44 percent of all 95th/Dan Ryan boardings) transfer from CTA buses and 2,250 riders (15 percent of all 95th/Dan Ryan boardings) transfer from Pace buses at the 95th/Dan Ryan terminal (CTA transfer data for October 2006).

The performance of these bus routes is shown in Table 2.8 below.

Table 2.8: CTA and Pace Bus Routes Serving 95th Street Station Performance

Route Number / Route Name	On-Time Arrivals
CTA #29 / State	79.7%
CTA #34 / South Michigan	55.7%
CTA #95E / 93rd/95th	51.8%
CTA #95W / West 95th	72.8%
CTA #100 / Jeffery Manor Express	49.8%

2.4 Specific Transportation Problems

2.4.1 Access to Jobs

The Far South Side of Chicago, including the study area, was hard hit by the decline in manufacturing that began in the 1970s and the recession of the early 1980s. Many of the major well-paying heavy industries were closed or relocated out of the area – Wisconsin Steel closed in 1980, the last Pullman railcar was produced in 1981, International Harvester and Dutch Boy

Paints left West Pullman, Republic Steel laid off 4,000 workers in 1984, and the USX South Works, which once had 20,000 workers, employed only 600 when it closed in 1993. Overall, the study area lost 38,000 jobs between 1970 and 2000.

With the loss of jobs, the study area provides only one job for every eight residents, as compared to the northeast Illinois region and City of Chicago job/population average of one job for every two residents. As a result, many residents must travel long distances to reach major employment centers, such as downtown Chicago and northwest Cook County. This results in longer commute times for study area residents. The 2000 Census indicates that commute times were 21 percent longer for study area residents than for the City of Chicago as a whole. Chicago's average commute time was 34.4 minutes, while commute times for residents on the Far South Side averaged 41.6 minutes.

Another motivating factor for the need to improve access to jobs in the study area is that one in five residents in the study area was below the poverty level in 2000. This population needs affordable transportation options to access jobs. Also, 22 percent of households in the study area in 2000 did not own a car. These residents are dependent on other means of transportation, such as transit, for job access and general mobility.

Furthermore, improved transit service will support ongoing efforts by the City of Chicago through their tax increment finance districts, redevelopment areas, and industrial corridors to spur economic development in the study area.

2.4.2 Difficult Access to the 95th Street Station

The CTA Red Line 95th Street station is located in the median of the I-94 Dan Ryan Expressway. A total of 19 CTA and Pace bus routes serve the 95th Street station. These bus routes all operate in mixed traffic with one-way route travel times averaging 46 minutes, one-way route distances averaging 12.4 miles, and ridership averaging nearly 3,600 passengers a day. This translates to an average bus speed of 9.5 miles per hour. By 2030, bus travel times are projected to increase by 20 percent.

Almost all of the bus routes operating in the study area experience their maximum load point in the vicinity of the 95th Street station. This results in greater customer boarding and alighting delays the closer the bus is to the 95th Street station.

Other major factors contributing to the longer bus route travel speeds and times to access the 95th Street station include the level of overall traffic congestion on the arterial streets in the corridors. As seen in Figures 2.10 and 2.11, existing 2000 and projected 2030 morning peak period congestion levels are very high in the study area, with approximately half of the major arterial street segments operating at volume-capacity ratios greater than one, and the other segments operating at higher volume-capacity ratios. These high volume-capacity ratios translate to poor levels of service on the roadway system, such that the ability to maneuver is severely restricted, vehicle speeds are reduced due to the higher volumes, and minor disruptions cannot be absorbed without extensive queues forming. The majority of traffic on these major arterial streets in the study area is through-traffic that begins and/or ends outside of the study area.

Other factors contributing to the difficult access to the 95th Street station include delays from at-grade freight railroad crossings in the study area. The Union Pacific Railroad (UPRR) has at-grade crossings of 95th Street, 103rd Street, 111th Street, 115th Street, 119th Street, and 130th

Street, all of which are used for CTA bus services. Currently, the UPRR has approximately 27 trains per day operating through the study area. Similarly, there are shorter delays for the Metra Electric District Blue Island Branch commuter trains that operate at-grade and cross Ashland Avenue, Halsted Street, and Michigan Avenue, which have CTA and Pace bus services. Consequently, bus operations under these conditions are very difficult and result in poor on-time performance.

Kiss-and-ride access to the 95th Street station is also difficult. There is no formal passenger drop off facility in the vicinity of the station, the station itself is congested with pedestrian and bus traffic, 95th Street is congested, and the one-way frontage road system east and west of the station is not conducive to efficient auto access to the station.

Pedestrian access to the 95th Street station is also constrained since the adjacent commercial and residential development is separated from the station by the Dan Ryan Expressway and adjacent frontage roads. Lafayette Street on the west and State Street on the east of the terminal serve as local arterials and access/egress roads for the expressway. Therefore, pedestrians required to cross these streets to access the terminal must contend with a vehicle mix traveling at varying speeds.

2.4.3 95th Street Station Bus Capacity and Delay

Nineteen CTA and Pace bus routes utilize the 95th terminal. Of these, two CTA routes and two Pace route (N5, N9, 395, 1012) operate infrequently or during overnight hours and do not require a bus bay in the morning peak period. In addition to CTA and Pace, Greyhound Bus Line occupies a bus bay in the terminal. Thus, a total of 16 bus routes require at least one bus bay during the morning peak. Based on procedures in the Transit Capacity and Quality of Service Manual, 27-32 bus bays required in the peak 15 minute time period. Since the 95th Street station bus terminal contains only 20 bus bays, the terminal is currently over capacity.

Bus circulation within the terminal is also slow due to tight turns and the frequent presence of pedestrians in the driveways. Bus routes assigned to berths in the west and north terminals drop off and pick up customers at the same location. This creates pedestrian congestion at the bus stop as disembarking passengers conflict with waiting customers on the curb. Bus routes assigned to the east terminal currently drop off passengers in the through lane in the west terminal. This occurs because passengers are not patient and will not wait until the bus reaches its assigned bus bay. Passengers are often observed pulling the emergency back door release to exit the bus as soon as it stops. Dropping off passengers in the through lane of the west terminal will occasionally prevent buses from entering the terminal and queues to form along 95th Street as buses wait to enter the terminal.

As a result of the insufficient number of bus bays, and passenger-pedestrian-bus conflicts, delays occur. Table 2.9 depicts the estimated total delay and delay per bus from 7:00 to 9:00 a.m. at the 95th Street bus terminal that can be expected based upon the number of buses accessing the bus terminal. Currently, there are 115 buses entering the 95th Street bus terminal, each with an estimated delay of 38 seconds. The cumulative bus delay is nearly one hour and 14 minutes. With growing population and employment in the study area, and slowing travel times on the bus routes, the number of buses will need to be increased. Table 2.9 shows the resulting delay at higher bus levels.

Table 2.10 provides the number of passengers boarding and alighting on CTA bus routes at the 95th Street station bus terminal between 7:00 and 9:00 a.m. Applying the 38 second delay per bus to the passenger volumes results in 34.4 hours of total passenger delay each weekday morning peak period.

Table 2.9: 95th Street Station Bus Terminal Delay (7:00-9:00 a.m.)

Number of Buses Entering the Terminal	Total Delay (hours)	Delay / Bus (minutes & seconds)
110	1:09:28	00:38
115*	**1:13:31**	**00:38**
120	1:17:41	00:39

2.4.4 Improved Transportation Equity for All Travelers

Transportation equity is the fair distribution of transportation resources so that no group carries an unfair burden of the negative environmental, social, or economic impacts, or receives an unfair share of benefits. In 2000, 21 percent of study area population had incomes below the poverty level. The study area population is almost entirely minority, comprised of 93.8 percent

African Americans and 2.7 percent Hispanics. Many study area residents do not have access to an automobile and rely on transit for mobility.

In addition, daily parking costs in downtown Chicago are among the highest in the United States, further limiting the study area population's access to downtown. Improvements to study area transit will serve all transportation system users, including low-income and under-represented populations.

2.5 Potential Transit Markets

2.5.1 Drive-Access Transit Market

A potential transit travel market in the study area that is not currently well served is drive-access transit trips. There are no CTA park-and-ride facilities on the Red Line Dan Ryan branch. All of the other CTA rail rapid transit branches, with the exception of the Green Line Lake Street branch have park-and-ride facilities. CTA's newest rail rapid transit line, the Orange Line that opened in 1993, has park-and-ride at five of eight stations.

In particular, the Red Line 95th Street station area, located in the median of one of the busiest expressways in the country, is very congested with bus, pedestrian, and vehicular traffic, making even kiss-and-ride access to the station difficult. In 2000, less than 17.9 percent of study area home-based work transit trips were via drive access. This percentage is projected to decline slightly to 17.5 percent drive access in 2030. Opportunities exist to provide CTA park-and-ride facilities to residents of the study area and increase the drive-access transit travel market.

2.5.2 South Transit Market

Another potential transit travel market is the south Cook County area located south of the study area. The provision of CTA park-and-ride facilities located in the southern portions of the study area near major expressways or arterial streets would provide convenient drive access possibilities to the CTA Red Line that do not currently exist. CTA has successful examples attracting these trips to transit. The Blue Line has park-and-ride facilities at Rosemont and Cumberland that are conveniently located near the I-90 Kennedy Expressway. A previous survey[6] at these Blue Line park-and-ride stations found auto access from 93 suburbs and that 74 percent of all trips originated in the northwest suburbs or northwest Chicago. The Chicago Central Area was the ending location of 78 percent of all park-and-ride trips, followed by the University of Illinois at Chicago at 6 percent.

Similar conditions, such as crowded expressways and expensive parking in the Chicago Central Area, face travelers from south Cook County and beyond. In 2000, nearly 17,000 daily home base work trips between the south Cook County area (District 19 in Figure 2.6) and the Chicago Central Area were made with a transit mode share of 48 percent. Opportunities exist to provide improved access to CTA from south Cook County and beyond.

2.5.3 Other Transit Markets

Additional potential transit travel markets, although smaller, include reverse commute and school trips. With an increase of 10,000 jobs in the study area by 2030 to 27,000, there is potential for increased reverse commute travel to access these jobs. There are several educational facilities in the study area, including Chicago State University (7,200 students), Olive-Harvey College (4,300 students), and several high schools including Harlan, Corliss, Fenger, Julian, Brooks and Carver, that would benefit from transit improvements in the study area.

---

[6] CTA O'Hare Park & Ride Surveys: Phase II, CTA Market Research Department, April 1994.

2.6 Project Goals and Objectives

The following proposed goals and objectives were developed based on the transportation needs described above as well as goals that are included in regional long-range transportation plans. The goals and objectives serve as the basis for evaluating the alternatives throughout the alternatives analysis. The goals and objectives are as follows:

- **Goal 1: Regional and Local Access and Mobility**

  Objectives:
  1. Increase connectivity between and within neighborhoods and activity centers.
  2. Improve access between city neighborhoods and regional centers, and between suburban communities and the greater central area.
  3. Increase regional transit competitiveness.
  4. Improve customer transfer connections among regional transit modes.

- **Goal 2: Community and Economic Development**

  Objectives:
  1. Support community development initiatives.
  2. Provide opportunity for transit-supportive development.
  3. Support efficient land use patterns.
  4. Respect community context and identity.
  5. Promote equitable distribution of project benefits and impacts.

- **Goal 3: Regional Transit System Performance**

  Objectives:
  1. Increase capacity and ridership.
  2. Enhance efficiency and cost effectiveness.
  3. Facilitate connections and linkages.
  4. Reduce transit travel times.
  5. Integrate existing transit infrastructure, where feasible.

- **Goal 4: Safety and Security**

  Objectives:
  1. Increase transportation reliability.
  2. Improve incident response capabilities.
  3. Incorporate design elements that enhance safety and security.

- **Goal 5: Environmental Quality**

  Objectives:
  1. Limit impacts.
  2. Support environmental benefits.
  3. Reduce reliance on automobile travel.

3.0 SCREEN 1 EVALUATION

The first step in the Red Line Extension Alternatives Analysis was to began with identifying the Universe of Alternatives, which is all the possible transit alternatives for the study area. The Universe of Alternatives included a wide range of transit modal technologies, study area corridors, and profiles (where the transit line is in relation to the ground).

3.1 Study Area Corridors

There were nine study area corridors identified, listed from west to east within the study area:

- I-57 Expressway
- Halsted Street
- Union Pacific Railroad
- Wentworth Avenue
- State Street
- Michigan Avenue
- King Drive
- Cottage Grove Avenue / MED CN Railway
- I-94 Bishop Ford Freeway

Figure 3.1 graphically depicts the nine corridors under consideration.

I-57 Expressway Corridor
The I-57 Expressway is located on the western boundary of the study area. The corridor extends west and south from I-94 and 95th Street. A complex, grade-separated junction allows traffic to interchange between I-57, I-94 Bishop Ford Freeway, and the I-94 Dan Ryan Expressway. I-57 has three lanes in each direction extending west to approximately Racine Avenue (with the highway running parallel and to the south of 98th Street) where it then turns south. By the time it crosses 127th Street (at the south end of the study area) the highway is running parallel and to the east of Paulina Street.

Major interchanges include the previously described junction with I-94, Halsted Street, 111th Street, 119th Street and 127th Street. Land use surrounding I-57 is predominantly residential from 95th Street to 112th Street (there is some industrial land to the west of the highway from 105th Street south). South of 112th Street and extending down to 119th Street, a large former industrial site is being made into a significant commercial center. Residential land use exists to the east of the highway in this section. South from 119th Street, land use to the west of the highway continues to be a mix of industrial and vacant parcels. Residential land use can be found on both sides of the highway from around 125th Street south. Commercial uses are generally located in all four quadrants of the interchanges with arterial streets.

There are also several educational and religious institutions in this corridor. Evers School is located north of I-57 on the east side of Lowe Avenue. Julian High School is to the west of the highway on the south side of 103rd Street. Morgan Park High School is located west of I-57, while Shoop Elementary School is on the east side of the highway, with both of these institutions being located north of 112th Street. The large Christ Universal Temple complex is on the east side of the highway, immediately to the south of 119th Street.

Halsted Street Corridor

Halsted Street is a major north-south arterial located at 800 West. The Halsted corridor would extend west along 95th Street or I-57 from I-94 and 95th Street to Halsted Street, about one mile to the west. At Halsted, the corridor turns south and remains in the approximate right-of-way of Halsted Street to the southern edge of the study area at approximately 127th Street, at or near the borders of Chicago, Riverdale and Calumet Park.

Halsted Street varies in width, but has a nominal width of 70 feet at most locations. The cross-section generally includes two through lanes, a parking lane in each direction, and a median. An at-grade crossing with the MED Blue Island branch occurs near 121st Street.

Land use is mixed from 95th Street to approximately 98th Street and then the properties fronting on Halsted are almost entirely commercial from 98th to around 117th Street. There are also residential structures located in this section and several churches. Strip malls front on Halsted at 104th Street (east side) and near 107th Street (west side). There is a nursing center on the east side of Halsted north of 110th Street. A large indoor mall (including a grocery store) is located on the west side of Halsted, north of 115th Street. A new, smaller mall is being built to the south of 115th Street. Mixed land use (including some light industry) is located between 117th Street and 123rd Street.

Land use tends to be mixed south of 119th Street, but there are also more vacant parcels interspersed in this area. Between 127th and 129th Street, land use is commercial on both sides of Halsted. There is a residential strip running along the north side of the Calumet River, which fronts on either side of Halsted at 129th Street.

Union Pacific Railroad (UPRR) Corridor

The UPRR Corridor extends west from the intersection of I-94 and 95th Street either along 95th Street, I-57, or south west along South Lafayette Avenue to the intersection with the UPRR right-of-way at about Eggleston Avenue and 99th Street (about one mile). The corridor then follows the UPRR alignment south from 99th Street to approximately 111th Street, where the railroad alignment begins to curve to the southeast. The alignment is at-grade as far south as 115th Street (the last grade crossing is at State Street, which is crossed to the south and east of 115th Street) and then the rail alignment transitions to a grade-separated alignment. The corridor turns due south after crossing the Metra Electric mainline/Canadian National (CN) tracks (approximately 119th/ Calumet), while the corridor would continue to head southeast-ward to terminate at approximately 130th Street and Stony Island Avenue (east of the crossing of 130th and the I-94 Bishop Ford Freeway).

A number of grade crossings have been closed along the UPRR alignment. Those that remain open are: 95th, 97th, 101st, 103rd, 107th, 109th, 111th, Princeton, Wentworth, 115th, Lafayette and State Street. The UPRR right-of-way is typically on the order of 100 feet in width, and the railroad is double-track throughout the study area. The alignment is being considered for Metra’s proposed SouthEast Service.

Land uses along the UPRR are open space to the west from 95th to 103rd Street, with residential being the predominant land use to the east in this section. From 99th to 100th Street there is a dedicated park immediately east of the corridor. From 103rd to 105th Street and between 107th and 108th Street, both sides of the corridor are given over to commercial/institutional uses (a City pumping station is located on the east side of the rail line south of 104th Street, for example). Between 105th and 107th and then again from 108th to 112th Streets, commercial land use is located to the west of the UPRR, with residential being the primary use to the east.

Active industrial concerns are to the east and west of the rail line at the 107th Street crossing. Light industries surround the corridor between 111th and 115th Streets. Residential use is present on both sides of the right-of-way from 115th with, mixed land use in evidence around Michigan Avenue. From 116th Street through the end of the community (around 119th and Prairie) the primary land use is residential.

From this location, the corridor would separate from the UPRR right-of-way, continuing on a diagonal to the southeast. Land use in the area east of the UPRR is industrial in nature, along with a major Metropolitan Water Reclamation District of Greater Chicago (MWRDGC) water treatment facility. The proposed transit line would run parallel to the NICTD line to a terminal near 130th/Stony Island.

Wentworth Avenue Corridor

The Wentworth Corridor begins at 95th Street and I-94 and extends about one-quarter mile west on 95th Street to Wentworth Avenue or southwest to South Lafayette Avenue along I-57. The corridor then heads south along Wentworth Avenue (200 west) to approximately 127th Street. The width of the Wentworth Corridor is most typically around 40 feet (one through lane and one residential parking lane in each direction), though south of 121st Street (near the at-grade crossing of the Metra Electric Blue Island Branch) the street width is never more than 30 feet. Wentworth also crosses the UPRR at-grade, just south of 114th Street.

Land use along Wentworth is almost entirely residential, except where it intersects the major east-west cross-streets (103rd, etc.) where there are some commercial enterprises. The Hughes School at 104th Street to the west of Wentworth, and the Van Vlissingen School around 109th Street and east of Wentworth are near the corridor.

State Street Corridor

The State Street corridor begins at 95th Street and I-94 and extends south along State Street (0 W) to 127th Street. State Street has some variation in overall width over the section of interest, but typically has an overall width of 42 feet. This street has at-grade crossings with the UPRR (south of 115th Street) and the Metra Electric-Blue Island Branch (around 121st Street). The branch's State Street station is located to the east of State on the north side of the single-track line.

Land use along State Street is a mix of recreational and educational to the east side between 95th and 98th (the I-90/94 expressway runs along the west side of the street). South of 99th Street, land use is residential on both sides, extending down to 110th Street. At intersections with major east-west cross streets, mixed use development exists.

From 110th to 115th the uses are mixed, and as we have seen on the other north-south streets in this area, the frequency with which one encounters vacant parcels increases in this section. There are also a few vacant buildings in this area.

Curtis Elementary School fronts on the east side of State north of 115th Street. Residential and mixed-use structures are on either side of State south of 115th Street. South of UPRR grade crossing, residential land use becomes dominant, extending down to 127th Street. Gompers Elementary School is located on the northwest corner of 124th, while the Jesse Owens Community Academy is on the west side of State south of 124th Place.

Michigan Avenue Corridor

This corridor follows 95th Street east from I-94 to Michigan Avenue and then remains along

Michigan Avenue (100 East), to the south limits of the corridor at 127th Street. Michigan's overall width varies, but is nominally around 40 feet. The UPRR is on retained fill where it crosses Michigan (around 116th Street). There is an at-grade crossing with the Metra Electric - Blue Island Branch around 121st Street. This line's State Street station is located immediately west of Michigan, but there is no entrance to the station from that street.

On the portion of this corridor along 95th Street, the land use is recreational to the south and a mix of commercial and residential on the north side of the street. Land use on Michigan is residential on the east side between 95th and 99th Street, with a mix of recreational and educational purposes to the west north of 98th Street, and then residential with some mixed-use south of 98th.

South of 100th Street, the land use along Michigan is predominantly commercial on both sides of the street, with an intermixture of residential structures. A multi-story church-supported housing structure is on the west side of the street south of 102nd Street. A variety of commercial uses can be found on the four corners at 103rd Street and Michigan Avenue.

A significant senior citizen housing complex has been constructed on the northwest corner of 105th Street and Michigan Avenue, while the southeast corner of this same intersection is occupied by a town house development. Mixed use, multi-story structures can be found at several locations along Michigan Avenue from 107th south to around 121st Street, as well as the churches. In the section from 111th Street to Kensington, the uses are predominantly commercial and the structures vary between one- and two-story, though the now-closed "Gatelys" store at 112th Street is significant for having a five-story parking structure that extends down the ridge from Michigan to Pembroke Avenue (one block to the east). A new grocery store is proposed on the southwest corner of 115th and Michigan.

Residential land use becomes dominant from 120th down to almost 127th Street, where Michigan ends. There is a significant recreational field on the east side of the street between 124th Place and 125th Street.

King Drive Corridor

The King Drive corridor follows 95th Street east from I-94 to Martin Luther King Jr. Drive (400 East, or one-half mile to the east), then turns south and follows King Drive to its end on the north side of 115th Street. King Drive's width varies, but is most typically around 40 feet. The cross-section is typically one through lane and a parking lane in each direction.

Land use on 95th Street is mixed residential and commercial. On King Drive, the land use is residential to the west side between 95th and 99th, and educational / institutional to the east between these same limits. South of 100th Street and extending down to 109th, land use is primarily residential on both sides, except at major east-west cross streets (such as 103rd Street) where it is commercial. Between 109th and 113th Street, land to the west is principally educational use (St. Martin de Porres Academy and Mendel High School), while the east side of King Drive is primarily residential. A large park is located on the west side of King Drive, south of 111th Street. The land use reverts to residential on both sides down to almost 115th, where King Drive ends in a commercial area. One of the parking lots serving the Metra Electric/NICTD Kensington station is located on the east side of King Drive to the north of 115th Street.

Cottage Grove / Metra Electric Corridor

This corridor runs east from 95th Street and I-94 approximately 1.1 miles to Cottage Grove Avenue at around 800 East, and the Metra Electric District alignment, which runs parallel and to the west side of Cottage Grove. It follows this alignment on a slight southwest angle down to the end of Cottage Grove around 119th Street. From the end of Cottage Grove, the corridor continues to the southeast paralleling the NICTD right-of-way to terminate at approximately 130th Street and Stony Island Avenue, along the same alignment as proposed for the southern end of the UP Railroad Corridor.

The Metra Electric/Canadian National (CN) right of way lies to the west of Cottage Grove, while there are a variety of land uses on the east side of the street. Between 95th and 99th Place the land use is commercial/industrial. There is a small pocket of residential development south of 98th Place and then a major industrial site which extends down to I-94. South of 100th, (and extending down to 108th) this shifts to predominantly residential, with some recreational facilities mixed in. From 108th to 111th the site of the former Pullman-Standard car building plant is on the east side of Cottage Grove. The Pullman Historic District is located south of 111th Street to the east of Cottage Grove.

Immediately to the east of Cottage there are mixed commercial and residential uses, culminating in the commercial area at 115th. To the south of 115th Street, it runs on the east side of a parking lot for commuters using the Kensington Station. It also passes to the east of the interlocking tower that controls the Kensington junction between the NICTD, MED, and CN lines. As noted previously, Cottage extends down to 119th Street in the industrial area that lies to the south and east of the UPRR ROW discussed above. Within this corridor, Cottage Grove varies in width, but is most typically on the order of 48 feet wide.

Schools along this corridor include: Chicago State University on the south side of 95th Street between King Drive and the Metra Electric/CN right-of-way; Smith Elementary School and Corliss High School (both located south of 103rd Street); Poe School north of 106th Street; and, the Pullman Elementary School, located north of 115th Street.

I-94 Bishop Ford Freeway Corridor

This corridor extends east and south from the intersection of I-94 and 95th Street. A complex, grade-separated junction allows traffic to interchange between I-94 Bishop Ford Freeway, I-57 and the I-94 Dan Ryan Expressway. The I-94 Bishop Ford Freeway has three lanes in each direction extending east to approximately Stony Island Avenue. It then continues running south to the extremity of the study area at 130th Street (west of Stony Island).

Interchanges include the previously described junction with I-94 and I-57, Stony Island Avenue/103rd Street, 111th Street, 115th Street and 130th Street. The highway intersects the Metra Electric-Mainline/CN tracks at Cottage Grove Avenue and the NICTD South Shore Line crosses over the highway just south of the 130th Street interchange. An Indiana Harbor Belt (IHB) freight railroad line parallels the South Shore Line from around 119th Street to the south limits of the study area. This line is used infrequently.

Land use surrounding I-94 Bishop Ford Freeway is predominantly recreational and educational on the east side of the highway south from 95th Street, becoming residential on both sides after passing under Michigan Avenue. East of King Drive the use is institutional and educational to the north (Secretary of State's facility and Chicago State University) and then residential to the south, extending east to Cottage Grove. The use is industrial to the north on the east side of Cottage Grove, and continues to be residential to the south of the highway. As the I-94 Bishop Ford Freeway swings south to intersect 103rd Street, the use is industrial to the west and educational (Olive-Harvey College) to the east. Between 103rd and 111th Streets the use is commercial to the west and recreational to the east. From 111th south to the end of the study area the land uses are industrial on both sides of the highway.

3.1.1 Corridor Evaluation

The corridor evaluation involved the analysis of the corridor alternatives based on their performance against relevant Screen 1 evaluation criteria. These criteria represent the Screen 1 measures that apply to each corridor regardless of the modal technology and profile developed within them:

- **Land Use:** Consistency and compatibility with surrounding land uses
- **Neighborhoods and Community:** Neighborhoods and residential population served with improved transit service
- **Poverty-status and Minority Access:** Poverty-status and minority populations served
- **Transit System Usage:** Service to activity centers within the study area and the region
- **Accessibility:** Directness to the existing Red Line 95th Street terminal station and the regional system

Three corridors, Halsted, UPRR, and Michigan were recommended to be carried forward as described in Tables 3.1 and 3.2.

Table 3.1: Summary Corridor Evaluation

Criteria	I-57	Hal-sted	UPRR	Went-worth	State	Michi-gan	King Dr.	Cottage Gr./MED/CN	I-94
Land Use	+	+	+	−	−	+	−	−	+
Neighborhoods/ Community	○	+	+	+	+	+	+	○	−
Poverty Status & Minority Access	○	○	+	+	+	+	+	+	−
Transit System Usage	−	+	+	○	○	+	○	+	−
Accessibility	−	○	+	+	+	+	+	○	−
Advance For Further Screening?	No	**Yes**	**Yes**	No	No	**Yes**	No	No	No

Key: **+** Better than other alternatives; ○ Same as other alternatives; **−** Worse than other alternatives

Table 3.2: Summary Corridor Evaluation Conclusions

Corridor	Advance for Further Screening?	Comments
I-57 Expressway	No	Corridor is on the western edge of study area and evaluates worse than other alternatives for accessibility and ability to improve transit service for new and existing customers.
Halsted Street	**Yes**	Corridor is highly transit supportive and could improve transit usage and accessibility to 95th Street. Halsted is a busy and active commercial corridor with the highest existing local bus usage in the study area.
UP Railroad (UPRR)	**Yes**	Corridor evaluates better than other alternatives for land use, neighborhoods served, poverty-status/minority access, transit usage, and accessibility.
Wentworth Avenue	No	Corridor is transit supportive. However, Wentworth Avenue is a local residential street and new transit infrastructure would be highly disruptive.
State Street	No	Similar to Wentworth Avenue, State Street is a residential corridor in the study area and not suitable for high capacity transit infrastructure.
Michigan Avenue	**Yes**	Corridor is highly transit supportive and could improve transit usage and accessibility to 95th Street.
King Drive	No	Corridor currently ends at 115th Street and would require high land acquisition cost to reach 130th Street.
Cottage Grove Avenue / MED CN	No	Corridor will not improve transit service or accessibility better than other alternatives.
I-94 Bishop Ford Freeway	No	Corridor is within a freeway. Transit usage, accessibility and neighborhoods and populations served worse than other alternatives.

3.2 Transit Technologies

A wide range of modal technologies were evaluated as part of the Universe of Alternatives. Eleven transit modal technologies were evaluated. They were grouped into three groups: rail, rubber tire and other modes. Together these generally encompass the entire domain of current transit technologies. These eleven technologies are:

Rail Transit: Rail is the designation for the alternatives operating as traditional rail technologies using steel wheels on steel rail. The rail guideways can be located in dedicated rights-of-way or in some cases, they can share the street with other vehicular traffic and pedestrians. Depending on mode and function, station spacing for these systems can be as close as ¼ to ½ mile in higher populated urban areas and one to five miles in areas with a lower population density. Rail propulsion power is generally from either diesel engines on board the vehicle or from electricity delivered from a distant generating location and distributed by overhead wires or a third rail that power the vehicle's electric motors. Hybrid engines, combining diesel and electric power on board the vehicle, are emerging propulsion system technology. The various rail transit alternatives for consideration include:

- Commuter Rail
- High Speed Rail
- Heavy Rail Transit (HRT)
- Light Rail Transit (LRT)
- Streetcar

Rubber Tire Transit: Similar to the rail transit, rubber-tire alternatives can travel at higher speeds or lower speeds, operate in dedicated travelways or in mixed traffic, and can use different propulsion systems, including standard diesel, hybrid, compressed natural gas, and electric. The various alternatives for consideration are presented below.

- Commuter Bus
- Local Bus
- Bus Rapid Transit (BRT)

Other Transit: Other transit generally represents advanced technology systems recently developed that do not ride on steel or rubber wheels or have so many variations for the guideway that categorization as either a rail vehicle or a bus vehicle would be difficult. These alternatives include:

- Maglev
- Automated Guideway Transit (AGT)/Monorail
- Personal Rapid Transit (PRT)

Figure 3.2 depicts these eleven transit technologies and Table 3.3 provides a summary of the operating characteristics of the eleven transit technologies.

3.2.1 Transit Technology Evaluation

The evaluation of the transit modal technologies was based on:

- **Study Area Suitability -** The modal technology has demonstrated the capability to match basic project needs for operating speeds and station spacing.

  Measures of Effectiveness (MOE):
  - *Length of Commute:* The typical commute length of the modal technology must be consistent with study area characteristics in terms of dimensions and area.
  - *Typical Station Spacing:* The typical station spacing of a modal technology must be consistent with the purpose and need of the project.
  - *Operating Speed:* The typical modal speed is consistent with the purpose and need of the project.

To meet the study area suitability criteria, the modal technology must have demonstrated the capability to match basic project needs such as operating speeds, station/stop spacing or length of travel.

	Rail Modes					Rubber Tire Modes			Other Modes		
Characteristic	**Commuter Rail**	**High Speed Rail**	**Heavy Rail Rapid Transit**	**Light Rail Transit**	**Streetcar**	**Commuter Bus**	**Local Bus**	**Bus Rapid Transit**	**Magnetic Levitation**	**Automated Guideway Transit**	**Personal Rapid Transit**
Type of Vehicle	Locomotive and train of cars; DMUs, EMUs	Locomotive and train of cars; EMUs	Trains of self-propelled cars	Self-propelled car or train of cars	Self-propelled car	Stand alone vehicle	Stand alone vehicle	Stand alone vehicle	Train of self-propelled cars	Train of self-propelled cars	Single self-propelled car
Vehicle Capacity	200-1800	500-600	800-1000	100-200	50-70	40	50-70	75-150	500-600	Varies per application	4 - 10
Propulsion	Diesel locomotives; electric motors	Usually electric motors supplied from catenary wire; also turbine powered locomotives	Electric motors supplied from 3rd rail or catenary	Electric motors supplied by overhead wire	Electric motors supplied by overhead wire	Internal combustion engine (diesel, natural gas or hybrid)	Internal combustion engine (diesel, natural gas or hybrid)	Internal combustion engine (diesel, natural gas or hybrid)	Electromagnetic coils supplied by wires in guideway	Electric motors supplied by power rail	Electric motors supplied by power rail
Service Configuration	Connecting suburbs to CBD	Intercity travel	Urban network with focus on CBD	Urban trunk line service	Line service on city streets	Express service to CBD or other major destinations	Line service on city streets	Urban trunk line service in exclusive lanes or guideway	Urban applications and intercity travel	Urban network, as well as shuttle or loop service	Point to point on demand
Travel Speed	30-50 mph	125-200 mph	25-50 mph	15-25 mph	10 mph	30-50 mph	10 mph	15-25 mph	25-250 mph	15 mph	15 mph
Station Spacing	3-7 miles	20 – 50 miles	1/4 to 2 miles	1/4 to 1 mile	2 - 4 blocks	Selected stops at each end of trip	2 - 4 blocks	1/4 to 1 mile	1 to 50 miles	Varies per application	Varies per application
In Transit Revenue Service in N. America	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	No	Yes	No

- **System Applicability -** The technology has been established as operationally feasible. Modal technologies that have not been implemented for public use in the U.S. were not recommended for further evaluation.

  Measure of Effectiveness:
  - Proven revenue service in North America.

Using these criteria, each transit modal technology was evaluated against its suitability for the study area and its applicability in the U.S. Table 3.4 summarizes this technology evaluation and show that AGT, BRT, HRT, and LRT transit technologies are recommended to be carried forward to the next step of the evaluation.

3.3 Technology and Profile Evaluation

The transit modal technologies can operate under four possible vertical profiles:

Elevated: An elevated structure is above ground, either on an embankment or on a structure. A local example of an elevated structure is the CTA rail track that forms the Chicago Loop and supports the Orange, Green, Pink, Brown and Purple lines. Other elevated structure examples include the embankment that supports the Red and Purple line tracks between Lawrence and Howard. Given that these structures only support one modal technology, service on these lines is faster than those profiles which may result in mixed traffic operation.

At-Grade: At-grade service runs at ground level. Examples of at-grade rail service are found on the CTA's Yellow and Brown lines, and throughout Metra's service network. CTA and Pace buses use the existing road network and most are therefore at-grade. At- grade services experience conflict points with other transportation networks, potentially resulting in lower operating speeds.

Trench: A trench profile is below ground, but not covered for any distance. Examples of transportation infrastructure that is in a trench can be found on significant parts of the expressway network in Chicago. A specific example of CTA rail in a trench is approaching the Orange Line Midway Airport terminal station. Riders need to ascend to ground level to access additional transportation services. Trench services are usually faster than at-grade due to the dedicated modal technology right-of-way that reduces intersections and potential conflicts with traffic.

Underground: Examples of underground or subways include the CTA Red and Blue lines in downtown Chicago. These subways are tunnels underneath ground level that minimize impacts of the transit facility on adjacent uses, and offer faster service than profiles that cross other transportation facilities at the same level.

Table 3.4: Technology Evaluation

Technology	**Does mode meet the MOE?**				**Advance for Further Screening?**	**Comments**
	Study Area Suitability			**System Applicability**		
	Length of Commute	**Typical Station Spacing**	**Operating Speed**			
Automated Guideway Transit	●	●	●	●	**Yes**	Typical station spacing and operating speeds suitable to the study area.
Bus Rapid Transit	●	●	●	●	**Yes**	Typical station spacing, operating speeds and flexible commute lengths suitable to the study area.
Commuter Bus	x	x	●	●	No	Typically serves point-to-point suburb to city travel. Trip lengths are not consistent with the study area needs.
Commuter Rail	x	x	●	●	No	Length of commuter trip and typical station spacing of 3-7 miles is not consistent with the study area needs.
Heavy Rail Rapid Transit	●	●	●	●	**Yes**	Typical station spacing and operating speeds suitable to the study area.
High-Speed Rail	x	x	x	x	No	Typically serves intercity travel. Length of commuter trip and typical station spacing of 20 miles not consistent with the study area needs.
Light Rail Transit	●	●	●	●	**Yes**	Typical station spacing, operating speeds and flexible commute lengths suitable to the study area.
*Local Bus**	●	x	x	●	No	Typical station spacing and operating speed not consistent with the study area and purpose and need.
Maglev	x	x	x	x	No	Typical station spacing of at least 20 miles required to achieve operational speeds is inconsistent with the purpose and need of the project.
Personal Rapid Transit	●	x	●	x	No	Typical station spacing, operating speeds and flexible commute lengths suitable to the study area.
Streetcar	●	x	x	●	No	Typical station spacing and operating speed not consistent with the study area and purpose and need.

Key: ●Yes, **x** No

* Local bus service, along with the CTA Rapid Transit and Metra service is analyzed as part of the “No Build” and TSM Alternatives

3.4 Screen 1 Findings

This section identifies specific issues which led to the recommendation or elimination of each alternative in Screen 1. Tables 3.5 and 3.6 summarize this evaluation.

Halsted Street Corridor At-Grade BRT

- At-grade BRT would be both compatibly with the existing system and cost effective on the Halsted Street Corridor. The street is generally an appropriate width and can support BRT bus service. This alternative is recommended for further evaluation in Screen 2.

Halsted Street Corridor Elevated HRT

- Elevated structures on the Halsted Street Corridor, though somewhat higher in cost, are feasible for elevated HRT service. This alternative is recommended for further evaluation in Screen 2.

Halsted Street Corridor Trench HRT

- A trench alignment in the Halsted Street Corridor would interfere significantly with traffic on the road both during construction and ongoing operation as a result additional right of way that would be required. This alternative is not recommended for further evaluation.

Halsted Street Corridor Underground HRT

- This alternative scores high on nearly all measures of effectiveness in this screening. Though potentially costly, an underground HRT alternative is feasible on Halsted Street. This alternative is recommended for further for further evaluation in Screen 2.

UPRR Corridor At-Grade BRT

- The existing use of this corridor for railroad operations does not have adequate right of way for at-grade BRT lanes. This alternative is not recommended for further evaluation.

UPRR Corridor Elevated and Trench HRT

- The existing use of this corridor is for railroad operations and is feasible for elevated HRT service. This alternative is recommended to advance for further evaluation in Screen 2.

UPRR Corridor Underground HRT

- Despite scoring well on some measures of effectiveness in screen 1, underground facilities are cost prohibitive in relation to the benefits provided in this corridor. This alternative is not recommended for further evaluation.

Michigan Avenue Corridor At-Grade BRT

- At-grade BRT would be both efficient and cost effective on the Michigan Avenue Corridor. Although the street has limited right-of-way, it may support an enhanced bus service and warrants further review. This alternative is recommended for further evaluation in Screen 2.

Table 3.5: Summary of Technology and Profile Evaluation

Technology	Profile	Criteria						Advance for Further Screening
		Air Quality	System Capacity	Travel Time	Compatibility	Traffic	Project Cost	
Automated Guideway Transit	Elevated	○	○	**−**	**−**	**+**	○	No
	Trench	○	○	**−**	**−**	○	○	No
	Underground	○	○	**−**	**−**	**+**	**−**	No
Bus Rapid Transit	Elevated	○	○	○	**−**	**+**	○	No
	At-Grade	○	○	○	**+**	○	**+**	**Yes**
	Trench	○	○	○	**−**	○	○	No
	Underground	○	○	○	**−**	**+**	**−**	No
Heavy Rail Rapid Transit	Elevated	○	**+**	**+**	**+**	**+**	○	**Yes**
	Trench	○	**+**	**+**	**+**	○	○	**Yes**
	Underground	○	**+**	**+**	**+**	**+**	**−**	**Yes**
Light Rail Transit	Elevated	○	○	○	**−**	**+**	○	No
	At-Grade	○	○	○	**−**	**−**	**+**	No
	Trench	○	○	○	**−**	○	○	No
	Underground	○	○	○	**−**	**+**	**−**	No

Key: **+** Better than other alternatives; ○ Same as other alternatives; **−** Worse than other alternatives

Michigan Avenue Corridor Elevated HRT

- Elevated structures on the Michigan Avenue Corridor, though somewhat higher in cost, are feasible for elevated HRT service. This alternative is recommended for further evaluation in Screen 2.

Michigan Avenue Corridor Trench HRT

- A trench alignment in the Michigan Avenue Corridor would interfere significantly with traffic on the road both during construction and ongoing operation as a result additional right of way that would be required. This alternative is not recommended for further evaluation.

Michigan Avenue Corridor Underground HRT

- This alternative scores high on nearly all measures of effectiveness in this screening. Though very costly, this underground HRT alternative is feasible Michigan Avenue. This alternative is recommended for further evaluation in Screen 2.

Table 3.6: Summary of Screen 1 Evaluation of Alternatives

Technology	Profile	Recommended to Advance to Screen 2		
		Halsted Corridor	UP Railroad Corridor	Michigan Corridor
Bus Rapid Transit	**Elevated**	No	No	No
	At-Grade	**Yes**	No	**Yes**
	Trench	No	No	No
	Underground	No	No	No
Heavy Rail Rapid Transit	**Elevated**	**Yes**	**Yes**	**Yes**
	Trench	No	**Yes**	No
	Underground	**Yes**	No	**Yes**

Based on this evaluation, two Bus Rapid Transit (BRT) alternatives along Halsted Street and Michigan Avenue, and six Heavy Rail Transit (HRT) alternatives along Halsted Street, the Union Pacific Railroad (UPRR), and Michigan Avenue, along with the No-Build and TSM alternatives were carried forward for further analysis in Screen 2.

4.0 SCREEN 2 EVALUATION

The Screen 2 evaluation begins with the alternatives that were carried forward from the Screen 1 evaluation.

4.1 Definition of Alternatives

Step 1 Evaluation

Step 1 of the Screen 2 evaluation process consists of further defining alternatives advancing from Screen 1 beyond the initial corridor and technology descriptions to also include mapping of a more defined alignment, identification of potential station locations, and sketch service plans. This definition assists in a more complete understanding of the unique elements of each alternative. It also provides a level of information about each alternative that supports more detailed evaluation. The alternatives are summarized below.

Bus Rapid Transit (BRT) Alternatives

BRT typically operates all or a portion of its route in a dedicated right-of-way. The proposed span of service for the BRT and HRT alternatives is the same as the current Red Line service hours, which operates 24 hours every day of the year. Few bus service changes are proposed for the BRT alternative due to requirement for customers to transfer between the BRT and the Red Line at 95th Street for travel to the Central Area.

The vehicles anticipated for the BRT alternative are articulated buses that would be hybrid diesel-electric powered or use alternative fuels. These 60 foot vehicles have a capacity of up to 115 passengers. A park-and-ride facility is recommended at the terminal station.

BRT Halsted Street At-Grade Alternative

This proposed BRT would operate at-grade on exclusive right-of-way between Vermont Avenue/Halsted Street and the Red Line 95th Street terminal station. For service planning purposes, station locations include Vermont Avenue, 123rd, 119th, 115th, 111th, 107th, 103rd, and 98th Streets.

BRT Michigan Avenue At-Grade Alternative

This proposed BRT would operate at-grade on exclusive right-of-way between 127th Street and the Red Line 95th Street terminal station. The alternative is planned with eight stations and it is 4.2 miles long. For service planning purposes, station locations include 127th, 123rd, 119th, 115th, 111th, 107th, 103rd and 98th Streets.

Heavy Rail Transit (HRT) Alternatives

HRT has been defined as operating in dedicated right of way completely separated from surface traffic on an elevated structure, underground or in a trench. Power would be provided via a third rail to match the existing CTA system. Trains would operate with 4 to 8 cars and the rolling stock would be equivalent to the existing fleet.

- **Elevated** indicates that most of the proposed new infrastructure is elevated except for portions where elevated infrastructure is not practical. Elevated HRT alternatives include the Halsted Street, UPRR and Michigan Avenue Corridors.
- **Underground** indicates that, where feasible, the majority of the proposed new infrastructure is underground, except for the portions necessary to connect to existing guideway or at the terminus rail yard where underground infrastructure is not practical.

Underground HRT alternatives include the Halsted Street and Michigan Avenue Corridors.

- **Trench** indicates that most of the proposed new infrastructure is located in a trench with limited or no permanent street closures. The single Trench HRT alternative being considered is the UPRR Corridor.

HRT Halsted Street Elevated and Underground Alternatives

Heavy rail would operate as either an elevated structure or underground. The alignment would begin at Vermont Avenue/Halsted Street to the I-57 Expressway median, following the median to existing CTA track south of 95th Street. For service planning purposes, station locations are assumed at Vermont Avenue, 119th, 111th, and 103rd Streets.

HRT Union Pacific Railroad (UPRR) Elevated and Trench Alternatives

Heavy rail would operate as an elevated structure or in a trench. The alignment would follow the I-57 Expressway until the UPRR corridor. It would then turn south along the corridor to approximately 111th Street where it would turn southeast to terminate at roughly 130th Street west of the I-94 Bishop Ford Freeway. For service planning purposes, station locations include 130th, 115th, 111th, and 103rd Streets.

HRT Michigan Avenue Elevated and Underground Alternatives

Heavy rail would operate on either an elevated structure or underground. The alignment would follow the southbound I-94 Bishop Ford Expressway median and transition to either an elevated structure or underground at Michigan Avenue. It would then head south along the Michigan Avenue Corridor to approximately 127th Street. For service planning purposes, station locations include 127th, 119th, 111th, and 103rd Streets.

No-Build Alternative

The No Build Alternative is defined as no new major construction within the study area, other than existing or committed projects in the CMAP 2030 Regional Transportation Plan. Minor spot improvements, transportation management measures, and/or signal projects may be constructed under the No Build Alternative. For additional information on planned transportation improvements in the study area see Section 5.1 – Definition of Alternatives; No Build Alternative.

TSM Alternative

The TSM Alternative represents lower cost improvements to address transportation issues in the study short of constructing a new fixed guideway. Bus service changes associated with the TSM Alternative include a new limited-stop express bus route. The proposed #X34 express bus route would operate along the current #34 South Michigan route, making stops at least half mile apart at frequencies of 7.5 minutes. The X34 South Michigan Express bus route would operate between 6:00 a.m. and 8:00 p.m. on weekdays only. Rush hour frequency on routes #34 and #X34 for the TSM Alternative are proposed at 11 minutes and 7.5 minutes respectively. Results from the ridership forecast in Screen 3 may necessitate changes to the TSM routing or these proposed frequencies if estimated demand exceeds proposed capacity.

4.2 Evaluation

Step 2 Evaluation

The evaluation criteria include a robust mix of qualitative and quantitative measures, but does not include ridership forecasting or detailed cost estimating. The Step 2 evaluation factors included:

- Physical Constraints
- Right-of-Way Requirements
- Social & Economic factors
- Demographics and Employment
- Environmental Factors
- Noise, Visual, Natural and Cultural Resources
- Transportation Factors
- Travel Time, Transit Connectivity and Traffic

During Step 2, three alternatives were eliminated, and the remaining alternatives advanced to Step 3. This Step 2 evaluation is summarized in Tables 4.1 and 4.2.

Table 4.1: Recommendations of Step 2 Evaluation

Step 2 Criteria	BRT		HRT					
	Halsted Street	Michigan Avenue	Halsted Street		UPRR		Michigan Avenue	
	At-Grade	At-Grade	Elevated	Under-ground	Elevated	Trench	Elevated	Under-ground
Physical Constraints	○	−	○	○	○	○	−	−
Social / Economic	○	○	○	○	○	○	○	○
Environmental	+	○	○	○	○	○	○	−

		Halsted Corridor	UP Railroad Corridor	Michigan Corridor
Bus Rapid Transit	**At-Grade**	**Yes**	No	No
Heavy Rail Rapid Transit	**Elevated**	**Yes**	**Yes**	No
	Trench	No	**Yes**	No
	Underground	**Yes**	No	No

Step 3 Evaluation

Step 3 is the last and most detailed evaluation within Screen 2. Remaining alternatives are evaluated using preliminary ridership projections and preliminary capital and operating cost estimates. Step 3 concludes with the recommendation to eliminate poorer performing alternatives and to advance those that are the stronger performers. Criteria used to evaluate the alternatives included:

- Capital Cost Comparison
- Operating and Maintenance (O&M) Cost Comparison
- Ridership Potential
- Cost Effectiveness

Table 4.3: Recommendations of Screen 2, Step 3 Evaluation

Project Cost and FTA Criteria	**BRT Halsted Street**	**HRT Halsted Street**		**HRT UPRR**	
	At-Grade	**Elevated**	**Under-Ground**	**Elevated**	**Trench**
Capital Cost	+	○	−	○	−

Heavy Rail Rapid Transit	**Elevated**	**Yes**	**Yes**
	Trench	Eliminated in Step 2	No
	Underground	No	Eliminated in Step 2

Screen 2 Alternative-Specific Issues

This section highlights the main issues that led to the recommendation and elimination of each alternative in Screen 2.

Halsted Street Corridor BRT At-grade, HRT Elevated and Underground

- The corridor is well suited for BRT at-grade and HRT elevated alternatives. Halsted Street is the largest and busiest arterial corridor in the study area with a four lane configuration and a 75’ right-of-way (ROW). These alternatives are recommended for further evaluation in Screen 3.
- The HRT Halsted Street Underground Alternative is expected to require the highest capital outlay. As result the HRT Underground Alternative was not recommended for further evaluation.

UPRR Corridor HRT Elevated and Trench

- HRT UPRR Alternative utilizes an existing freight rail right-of-way through much of the study area and is well suited for HRT Elevated alternative. The ROW width is 100 feet south of the I-57 bridge to104th Place. From there the width varies between 50 to 100 feet until 111th Street. South of 111th Street, the ROW is over 100 feet in width. The HRT UPRR Elevated Alternative is recommended for further evaluation in Screen 3.
- An open cut, or trench, profile would require placing both the UPRR and the Red Line extension within a trench. The UP line would require temporary relocation during construction. A crash wall separating the UPRR and CTA tracks may also be required if both lines were to go in a trench, which may require acquisitions in narrower segments of the ROW. This would substantially increase the construction cost compared to the elevated alternative. As result the HRT UPRR Trench Alternative was not recommended for further evaluation.

Michigan Avenue Corridor BRT At-Grade, HRT Elevated and Trench

- Michigan Avenue varies from 48 feet wide at 95th Street to 38 feet between curbs at 103rd Street. Taking 22 feet for the BRT lanes would leave 26 feet for auto lanes at 95th Street, but just 16 feet for auto lanes at 103rd Street. While it is possible to rebuild the street to increase the curb-to-curb width, this would have a negative impact on the built-up areas along Michigan Avenue. The BRT and HRT Michigan Avenue Alternatives, compared to other alternatives, would require significant right-of-way acquisitions.
- Michigan Avenue stub-ends at 127th Street within a developed residential area and there is no obvious BRT or HRT terminal location at this intersection without undertaking significant property acquisition.
- In the case of the HRT alternatives, the elevated and underground profile, while providing an alignment free from traffic interference, would be highly disruptive to the commercial and residential areas along Michigan Avenue. This would be true both during construction and subsequent operation.
- Therefore, the BRT and HRT Michigan Avenue alternatives received negative ratings in Screen 2 and were not recommended for further evaluation.

Screen 2 concluded with public involvement including meetings with elected officials and other stakeholder groups, as well as two public open houses in December 2008. As shown in Table 4.4, a BRT alternative along Halsted Street, and two HRT alternatives along Halsted Street and the UPRR, along with the No Build and the TSM alternatives were carried forward for more detailed evaluation in Screen 3.

5.0 SCREEN 3 EVALUATION

Screen 3 was comprised of a two-step evaluation process that included the further definition and refinement of alternatives and the evaluation of these alternatives. The result of the Screen 3 evaluation was a recommendation for an LPA.

5.1 Definition of Alternatives

Alternatives advancing to Screen 3 were developed and refined beyond the initial corridor and technology descriptions to include the conceptual design of the alternative, the identification of potential station locations, and preliminary service plans. This alternatives definition assists in a more complete understanding of the unique elements and requirements for each alternative. It also provides a more complete level of information about each alternative that supports increasingly detailed evaluation. The alternatives recommended from Screen 2 for further study include:

- No Build Alternative
- Transportation System Management (TSM)
- Bus Rapid Transit (BRT) via Halsted Street Corridor At-Grade
- Heavy Rail Rapid Transit (HRT) via Halsted Street Corridor Elevated
- HRT via UP Railroad (UPRR) Corridor Elevated

No Build Alternative

The No Build Alternative is defined as the existing transportation system, plus any committed transportation improvements. Committed transportation improvements include projects that are already in the Chicago Metropolitan Agency for Planning (CMAP) financially constrained Transportation Improvement Program. The Red Line Study Area has five bridge reconstructions, and several road improvements projects included in the FY 2007 – 2012 Transportation Improvement Program (TIP). These improvements are primarily on highway segments in the project study area and are not adjacent or intersecting with the proposed TSM or Fixed Guideway Alternatives.

The bridge projects include:

- Illinois 1 (Halsted Street) at the Little Calumet River, slated for completion by 2012
- I-94 (Bishop Ford Expressway) at the Stony Island ramp and at Cottage Grove Road, both scheduled for 2011
- I-57 at 103rd Street, to be completed in 2009
- I-57 at Genoa Rd, scheduled for 2011

The road projects include:

- Coordinating signal timing on Stony Island Avenue from 95th Street north, and on 95th Street from Western Avenue east to Ewing Avenue, to be completed in 2010
- Resurfacing I-94 (Bishop Ford Expressway) from ML King Drive south, scheduled for 2011
- Landscaping I-57 from I-94 south, to be done by 2012

- Landscaping and installing safety fencing and lighting along I-94 from the I-57 merge north, to be done in 2009
- Patching pavement on I-57 in various locations, with an unspecified completion date

Other miscellaneous projects include a drainage project on I-94 (Bishop Ford Freeway) at 110th Street and Doty, which is scheduled for completion in 2012, and several historic preservation projects. These include the Hotel Florence at 11111 S. Forestville and the North Pullman Historic Area, both in the Pullman neighborhood of Chicago, which are scheduled to be completed in 2011.

A multi-use trail from the existing Centennial Trail in Lemont to the Burnham Greenway in Burnham, has funding identified but does not have a completion date.

Bus transit service under the No Build Alternative would be focused on the preservation of existing services and projects. No significant changes to bus service are anticipated in the project area.

All elements of the No-Build alternative are included in each of the other alternatives. The No-Build Alternative with TIP projects in the Red Line Extension Study Area is shown in Figure 5.1.

Halsted Street TSM/BRT Alternative

Based on discussions with the FTA, consolidation of the TSM and BRT Halsted Street Corridor alternatives was analyzed. The TSM and BRT alternative was initially defined to operate on a five mile alignment between the Red Line 95th Street station via Halsted Street to Vermont Avenue/127th Street.

The proposed TSM Alternative is a 5.1 mile BRT alternative that would operate between the 95th Street Station and 127th Street via Halsted Street. 95th Street is 80 feet wide with four lanes, center turn lane, landscaped median and no parking. ADT on 95th Street is 23,800. Halsted Street is the busiest north-south arterial street in the Red Line study area with nearly 37,000 vehicles ADT north of I-57 Expressway and more than 26,000 vehicles ADT to the south of the expressway. Halsted Street has a 75 foot right-of-way with four lanes, landscaped median with center turn lane, and parking.[7]

Full-scale BRT installations can provide significant travel time savings. The travel time savings for implementing BRT on the five mile route between 95th Street Station and Vermont Avenue/127th Street is 2.0 to 3.0 minutes relative to the TSM (assumes that the order of magnitude of travel time savings is between 15 and 20 percent that full-scale BRT could be expected to achieve over the TSM alternative). Given the order-of-magnitude of capital costs for implementing BRT on Halsted Street is $40 million and travel time savings are only 2.0 to 3.0 minutes over the TSM, CTA decided to merge the TSM and BRT alternatives into a single new TSM/BRT alternative. This new TSM/BRT Alternative replaced the TSM and BRT Alternatives from the Screen 2 analysis and was used for the detailed evaluation in Screen 3.

The TSM/BRT Alternative is an enhanced bus route from the existing Red Line 95th Street terminal to Vermont Avenue. It is proposed to operating in mixed-traffic along 95th Street and Halsted Street. The TSM/BRT Alternative is shown in Figure 5.2, and includes the following characteristics:

- The alternative is 5.1 miles long with four stations.
- Stations are assumed at 103rd, 111th, 119th Streets and Vermont Avenue.
- The average travel time from Vermont Avenue to 95th Street is 24.25 minutes. This includes a 2.25 minute wait time at Vermont Avenue.
- Traffic signal priority would be implemented along Halsted Street and 95th Street (similar to the previous TSM and BRT alternatives).
- Preliminary schedules indicate that four 60-foot articulated buses vehicles (including 1 spare) would be required.
- 95th Street terminal would be expanded to extend the existing bus bays along State and Lafayette Streets approximately 250-feet north to 94th Street to improve circulation and safety.
- Park and ride facilities are recommended at intermediate and terminal stations with a total capacity of 700 spaces in the year of construction.

HRT Halsted Street Elevated Alternative

An extension of heavy rail transit would operate on an elevated structure between the existing Red Line 95th Street Terminal station and Halsted Street/Vermont Avenue. The alignment would follow the median of I-57 Expressway until Halsted Street. It would then turn south at Halsted Street and continue in median to Vermont Avenue.

The HRT Halsted Street Alternative is shown in Figure 5.3, and includes the following characteristics:

The alignment considered for detailed evaluation is described as follows:

- The alternative is 5.0 miles long with four stations.
- Station locations are assumed at 103rd, 111th, 119th Streets and Vermont Avenue.
- The average travel time from Vermont Avenue to 95th Street is 16.25 minutes. This includes a 2.25 minute wait time at Vermont Avenue.

- Based on the estimated running time for the Halsted Street alignments, an additional 78 cars (including 14 spares) are required for the AM rush period.
- Park and ride facilities are recommended at intermediate and terminal stations with a total capacity of 1500 spaces in the year of construction.
- CTA has previously determined that the 98th Shop is in need of replacement and has made plans separate from this project to address those needs. For that reason, the replacement of 98th Shop and a new Red Line yard and shop is not considered to be part of the HRT Halsted alternative.

Michigan Avenue TSM/BRT Alternative

Based on discussions with FTA, the TSM/BRT Michigan Avenue alternate was introduced as a new alternative in Screen 3 for purpose of evaluation against the HRT UPRR Corridor Elevated Alternative. The proposed TSM Alternative is a 5.5 mile BRT alternative that operates between the 95th Street Station and 130th Street via East 95th Street, Michigan Avenue, East 127th Street, South Indiana Avenue and East 130th Street. 95th Street is 80 feet wide with four lanes, center turn lane, and no parking. Michigan Avenue averages 40 feet wide with two lanes and parking. 127th Street and Indiana Avenue are 40 feet wide with four lanes and no parking. 130th Street is 60 feet wide with four lanes, a center turn lane and no parking. On 95th Street, ADT is currently 23,800, ADT on Michigan Avenue between 95th Street and 127th ranges between 10,700 (at 107th Street) and 7,100 (at 127th Street), on 127th and Indiana Avenue Street 21,100, and 130th Street, ADT is 19,600. [8]

Previously in Screen 2, both HRT and BRT alternatives for the Michigan Avenue Corridor were eliminated due to physical constraints and potential displacements from the need for additional right-of-way along Michigan Avenue to accommodate the separate guideway/roadway for HRT and BRT. This TSM/BRT Michigan Avenue alternative would consist of enhanced bus service operating in existing street right-of-way. This new TSM/BRT Alternative thus introduced a separate TSM/BRT Alternative that was used for detailed evaluation in comparison to the locally preferred alternative (LPA).

The TSM/BRT Alternative would include the provisions of the No Build Alternative and add a limited-stop enhanced bus route, #X34, along the existing #34 South Michigan Avenue bus route to 130th Street and I-94 Bishop Ford Freeway. The TSM/BRT Alternative is shown in Figure 5.4, and includes the following characteristics:

- The alternative is 5.5 miles long with four stations.
- Stations are located at 103rd, 111th, 115th and 130th Streets.
- The average travel time from 130th Street to 95th Street is 25.25 minutes. This includes a 2.25 minute wait time at 130th Street.
- Preliminary schedules indicate that ten 60-foot articulated buses (including two spares) would be required.
- Traffic signal priority would be implemented along 95th Street, Michigan Avenue and 130th Street (similar to the previous TSM and BRT alternatives).
- 95th Street terminal would be expanded to extend the existing bus bays along State and Lafayette Streets approximately 250-feet north to 94th Street to improve circulation and safety.
- Park and ride facilities are recommended at intermediate and terminal stations with a total capacity of 700 spaces in the year of construction.

HRT Union Pacific Railroad (UPRR) Elevated Alternative

CTA was aware of concerns about shared-use transit and freight railroad corridors as a result of shared use corridor incidents that have occurred in other parts of the country. Conceptual designs and cost estimates for that portion of the Red Line extension that would be on shared-use ROW include additional safety provisions (25 foot separation, elevated grade separation, intrusion fencing with alarms to both the CTA and UPRR control centers, as well as a crash wall between the UPRR tracks and the CTA structure) in an effort to address what was understood to be concerns as directly as possible.

During Screen 3, a meeting was held with CTA, CDOT and UPRR representatives to discuss the potential Red Line Extension and the UPRR freight railroad shared use corridor. At this meeting, the UPRR indicated that they required a 50 foot separation distance between their tracks and a transit line. This separation distance was based on research investigations as to how best to ensure safety and protect the operations and physical plant of the UPRR. In addition, the UPRR desires to maintain its current ROW footprint in order to allow for future expansion. It would not be possible for the CTA structure to be located on the UPRR ROW and provide the required separation distance.

This led the CTA study team to examine options for locating the CTA rail line beyond the east and west limits of the UPRR ROW. As result, the HRT UPRR Alternative includes both an East and West alignment option for detailed evaluation in Screen 3.

The HRT UPRR Alternative is shown in Figure 5.5, and includes the following characteristics:

- The alternative is 5.3 to 5.6 miles long depending on terminal location and includes four stations.
- Station are located at 103rd, 111th, 115th and 130th Streets.
- The average travel time from 130th Street to 95th Street is 16.25 minutes. This includes a 2.25 minute wait time at 130th Street.
- Based on the estimated running time for the UPRR alignments, an additional 78 cars (including 14 spares) are assumed for the AM rush period.
- Park and ride facilities are recommended at intermediate and terminal stations with a total capacity of 1,500 spaces in the year of construction.

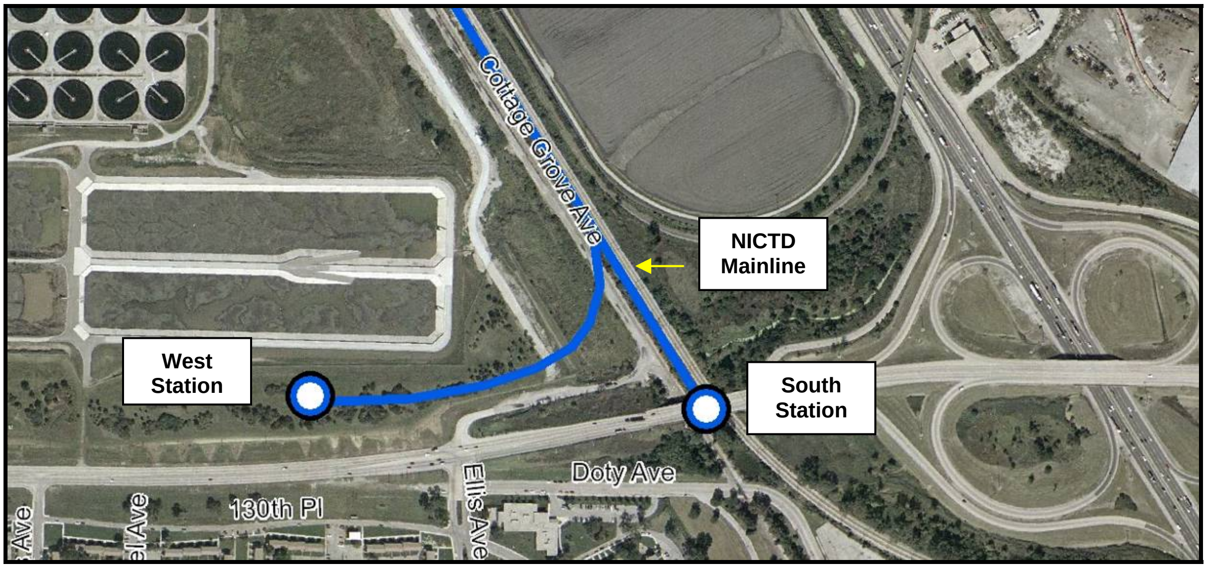
A new Red Line yard and shop facility with a 276-car capacity, would be located on a combination of industrial/vacant land to the east of the CN/MED tracks and west of the IHB and NICTD tracks at approximately 120th and Cottage Grove. The CTA has previously determined that the 98th Yard and Shop is in need of replacement and has made plans separate from this project to address those needs. For that reason, the replacement of 98th Yard and Shop and a new Red Line yard and shop is not considered to be part of the HRT UPRR alternative.

Two 130th Street terminal station locations, a south and a west option, are proposed. They are differentiated primarily in environmental factors and capital cost at this stage of the analysis. The south and west terminal station options are shown in Figure 5.6.

- *UPRR ROW to 130th- South Station Option.* The alignment terminates along the former IHB railroad right-of-way immediately north of 130th Street. The station platform would extend underneath the existing 130th Street /IHB Bridge to provide access to the Altgeld Gardens development on the south side of 130th Street. Line length is 5.3 miles long.
- *UPRR ROW to 130th- West Station Option.* For this variation, around 128th Street the double track HRT line swings off the former Michigan Central/Indiana Harbor Belt ROW to the west, running along the north side of 130th Street. The location is parallel to 130th street and provides access to the residential areas and the Altgeld Gardens development on the south side of 130th Street. Line length is 0.3 miles longer than the previous alternative, for an overall length of 5.6 miles.

Figure 5.6: HRT UPRR South and West Station Options



5.2 Screen 3 Evaluation

A summary Screen 3 evaluation matrix was developed. The evaluation factors used to assess the performance of the alternatives included:

- Physical Constraints
- Public Support
- Social/Economic Factors

- Environmental Factors
- Transportation Factors
- Capital Cost Comparison
- Operating and Maintenance (O&M) Cost Comparison
- Ridership Potential
- FTA Cost Effectiveness Index (CEI)

The Screen 3 analysis resulted in a preliminary recommendation for the HRT UPRR Alternative as the Locally Preferred Alternative, and is shown in Table 5.1.

Table 5.1: Screen 3 Evaluation Summary and LPA Recommendation

Screening Criteria	No-Build	TSM/BRT		HRT	
		Halsted	Michigan	Halsted	UPRR West and East Option
		At-Grade	At-Grade	Elevated	Elevated
Physical Constraints	NA	○	○	○	−

LPA Recommendation	No	No	No	**Yes**	**Yes***

Key: + Better than other alternatives; ○ Same as other alternatives; − Worse than other alternatives
* Subject to cost-effectiveness requirements

Specific issues that led to the recommendation or elimination of each alternative in Screen 3 are summarized below.

TSM/BRT Halsted Street and Michigan Avenue At-Grade

- Expansion of the 95th Street terminal to extend the existing bus bays along State and Lafayette Streets approximately 250-feet north to 94th Street to improve circulation and safety both TSM/BRT alternatives.

- Halsted Street can accommodate additional buses without modification to the right of way or traffic lanes.
- Michigan Avenue can accommodate additional buses without modification to the right of way or traffic lanes. However, the corridor has two vehicle lanes with parking and would require removal of parking lanes for some portions of the alignment.

Halsted Street Elevated

- Right-of-way is sufficiently wide to accommodate both construction and operation of a HRT system with the median of the roadway, though impacts to businesses and streetscape would occur along the corridor during construction and subsequent operation. The commercial character of the corridor and its location adjacent to residential neighborhoods is transit supportive.

UPRR Elevated

- Public support for the HRT UPRR alternative rated highly in the evaluation due the high number of public comments received for this alternative throughout Screens 1, 2 and 3. 451 public comments were received in Screens 1, 2 and 3 – 140 of those expressed a preference for a particular alternative. 85 (60.7%) of these comments were in favor of the UPRR Rail alternative and 7 (5%) were in favor of the Halsted Rail alternative. 29 (20.7%) Comments showed general support of an extension of the Red Line, and 19 (13.6%) comments specifically support extending the line to 130th Street with no particular alternative mentioned.
- In June 2009, a petition was submitted to CTA including 512 signatures supporting the CTA's locally preferred route to extend the Red Line Rail Line from the 95th Street Station to 130th Street, using the Union Pacific Rail Road (UPRR) corridor.
- In November 2004, over 38,000 residents in the 9th and 34th wards supported a public referendum for the Red Line Extension along the UPRR Corridor. A total of 38,142 'Yes' votes (93%) and 2,993 'No' votes were cast.
- The HRT UPRR alternative scores well on most criteria but scores a negative on physical constraints. Due to recent accidents, the transportation industry is adopting greater separation between freight railroad and transit operations to increase safety. Based on discussions with the UPRR, a 50-feet separation distance is desired from the UP freight railroad tracks. Extension of the Red Line immediately adjacent to west or east of the UPRR ROW will result in adjacent property acquisition.

Screen 3 concluded with public involvement including meetings with elected officials and other stakeholder groups as well as two public meetings in June 2009.

5.3 Screening Summary

Figure 5.7 presents a summary of the three screenings, beginning with the Universe of Alternatives, followed by Screens 1, 2, and 3, and the LPA recommendation for the elevated HRT adjacent to the UPRR to 130th Street.

6.0 LOCALLY PREFERRED ALTERNATIVE

6.1 Selection of a Locally Preferred Alternative

On August 12, 2009, the Chicago Transit Board approved an elevated HRT extension adjacent to the UPRR to 130th Street as the LPA. This recommendation was based on the technical work described in previous sections of this report, and based on public, stakeholder, and agency input. This section further describes the LPA (and No Build and TSM alternatives, which must be carried forward) and evaluates the extent to which the LPA addresses the goals and objectives for the project compared to No Build and TSM/BRT alternatives.

6.2 Description of Service Plan

Significant characteristics of the proposed service plan for each of the No Build, TSM/BRT and LPA are summarized below.

6.2.1 Alternative Descriptions

No Build Alternative

The No-Build Alternative is defined as the existing transportation system, plus any committed transportation improvements. Committed transportation improvements include projects that are already in the Chicago Metropolitan Agency for Planning (CMAP) financially constrained Transportation Improvement Program. Bus transit service under the No Build Alternative would be focused on the preservation of existing services and projects. In the 2030 design year, the transit network within the project area would largely be the same as it is now with similar service frequencies.

The No-Build Alternative also establishes the baseline for comparison of the cost-effectiveness of the TSM/BRT and HRT UPPR alternative. All elements of the No-Build alternative are included in each of the other alternatives except where an alternative replaces services or facilities inside the study area.

TSM/BRT (Michigan Avenue to 130th Street)

The TSM/BRT Alternative is a 5.5 mile BRT alternative that operates along the existing #34 South Michigan bus route from the Red Line 95th Street terminal station to 130th Street and the I-94 Bishop Ford Freeway near Altgeld Gardens. This alternative will require a net increase of eight buses plus two spares.

Three types of service modifications have been identified for the TSM/BRT Alternative to provide the best address the project Purpose and Need in Section 1 without constructing a new fixed guideway.

- The first includes frequency adjustments during peak periods to better serve anticipated demand. The TSM/BRT alternative proposes a four minute frequency between 6:00 a.m. and 8:00 p.m. on weekdays and a 12 minute frequency on the existing route 34.
- The second modification would implement BRT operational characteristics short of a dedicated lane to improve accessibility and running times. BRT characteristics include transit signal priority, improved bus shelters and park and ride facilities at the 103rd, 111th, 115th and 130th Street stations.

- The third modification would be expansion of the 95th Street terminal to extend the existing bus bays along State and Lafayette Streets approximately 250-feet north to 94th Street to improve circulation and safety.

LPA (elevated HRT adjacent to UPRR to 130th Street)

The Red Line Extension would operate on an elevated structure. The alignment would follow the I-57 Expressway until the UPRR corridor. It would then turn south along the corridor to approximately 111th Street where it would turn southeast to terminate at roughly 130th Street west of the I-94 Bishop Ford Freeway. Stations would be located at 103rd, 111th, 115th and 130th Streets. Park-and-ride facilities are assumed at each station.

The LPA is anticipated to operate train sets consisting of four or eight cars. The maximum scheduled capacity of each car is 90 passengers, which provides a maximum capacity of 360 passengers for a 4-car train, and a maximum capacity of 720 passengers for an 8-car train. The current Red Line vehicle requirements during the AM peak period is 304 cars. Based on the estimated running time for the LPA to 130th Street, an additional 78 cars will be required in the AM rush period. This estimate includes 64 cars required for the schedule, plus 14 spares.

The proposed span of service for the LPA is the same as the current Red Line, which operates 24 hours every day of the year. The LPA service frequency is expected to be the same as current service, which is approximately five minutes in the northbound direction and four minutes southbound during the AM peak period.

Table 6.1: LPA and Existing Northbound Red Line Weekday Service Characteristics

Service Period	Hours	Time Period	Average NB Frequency (minutes)	Train Length	Vehicles Required
Weekday					
Early Morning	3.0	03:00 - 06:00	13	8	
AM Peak	3.0	06:00 - 09:00	5	8	304
Base	6.0	09:00 - 15:00	7	8	184
PM Peak	3.0	15:00 - 18:00	5	8	304
Evening	4.0	18:00 - 22:00	7.5	4	
Late Evening/Owl	5.0	22:00 - 03:00	15	4	48
Weekday Total Hours	24.0				

6.2.2 Running Time

Table 6.2 shows the northbound running times for the existing Red Line and the No Build, TSM/BRT, and LPA. The existing Red Line northbound running time between the 95th Street station and the downtown Jackson Station is 25 minutes in the AM rush period.[9] To travel between 130th Street and Jackson Boulevard requires 57.0 minutes in the AM peak period for the No Build and 52.0 minutes for the TSM/BRT. The LPA is projected to have most significant time savings with a running time of 39.0 minutes from 130th to Jackson.

---

[9] Source: CMAP New Starts model

Table 6.2: Estimated Northbound Running Times

Route Segment	Running Time (minutes)			
	Current Red Line	No Build	TSM/BRT	LPA
95th to Jackson	25.0			
95th to Clark/Division	32.5			
95th to Howard	61.5			
130th to 95th		28.00	23.0	14.0
130th to Jackson		57.0	52.0	39.0
130th to Clark/Division		64.5	59.5	46.5
130th to Howard		93.5	88.5	75.5

5.2.3 Proposed Bus Route Changes

The bus route changes outlined below are proposed service plans designed to speed passenger travel to downtown Chicago.

LPA Proposed Bus Service Changes

- CTA route #9 Ashland currently terminates peak period trips at 104th/Vincennes. These trips are proposed to terminate at 103rd Station on the new UPRR alignment.
- The current south terminal for CTA route #34 South Michigan is 131st/Ellis. It is proposed that route #34 continue to the new terminal at 130th/I94, operating via 130th Street, Eberhart, 131st, Langley, 133rd Place, Ellis and 130th Street.
- It is proposed that CTA routes #103 West 103rd and #106 East 103rd be combined into one route operating between a west terminal at Pulaski and an east terminal at Stony Island. This will reduce the number of bus routes terminating at 95th while still providing access to the Red Line at 103rd Station.
- To further reduce the number of bus routes terminating at 95th Station, it is recommended that CTA route #108 Halsted/95th be eliminated. The need for express bus service in this corridor is reduced with the implementation of new rail service.
- Routes #112 Vincennes/111th and #111 Pullman/111th/115th are recommended for restructuring to simplify the route paths and better serve the new alignment. Route #111 would operate on 111th between 111th/Pulaski and 111th/Corliss, serving the new 111th Station. A new route #115 would operate as a two-directional loop on 115th, Cottage Grove, 95th Street and Vincennes. Route #112 is recommended for elimination under this proposal.
- Route #119 Michigan/119th is proposed to terminate at 115th/Michigan Station.
- The south terminal of Route #348 is proposed to terminate at 130th/I94, extending the route from the current turnaround at 136th/Indiana. In addition, CTA route #30 South Chicago will terminate at the new terminal at 130th/I94, moving from its current terminal at 130th/Exchange.
- For directness, route #352 Halsted is proposed to terminate at 111th Station instead of 95th. The north terminal of route #359 Robbins/South Kedzie is proposed as 115th Station instead of 95th. Terminating route #353 south of 95th will remove bus service from King Drive between 111th Street and 95th Street. For this reason no changes are proposed for route #353.

TSM/BRT Proposed Bus Service Changes

- Bus service changes associated with the TSM/BRT Alternative to 130th Street include a new enhanced bus route along Michigan Avenue. The proposed X34 enhanced bus route would operate along the current 34 South Michigan route and extend to 130th Street to serve Altgeld Gardens on a 4 minute peak headway. The headway for route 34 would be reduced to 12 minutes due to the addition of the enhanced bus X34. There are no other bus routes proposed to be changed for the TSM/BRT Alternative.

Table 6.3 lists the bus routes that currently operate within the study area. Changes to current bus operations on individual routes are proposed for each of the alternatives. The proposed bus route changes for the LPA and TSM/BRT are shown in Figures 6.1.

Table 6.3: Proposed Bus Routes Changes

Bus Route	LPA	TSM/BRT
8A	None	None
9	Terminate 104th/ Vincennes trips at 103rd	None
30	Terminate at 130th	None
34	Terminate SB at 130th	New X34
103	Combine with #106	None
106	Combine with #103	None
108	Eliminate	None
111	Serve 111th between 111th/Pulaski & 111th/Corliss.	None
115	New bi-directional loop route via 115th, Cottage Grove, 95th St & Vincennes	No new route
112	Eliminate	None
119	Terminate at 115th/Michigan	None
348	Terminate SB at 130th	None
352	Terminate at 111th	None
353	None	None
359	Terminate at 115th	None

6.3 LPA Transportation Characteristics

The following transportation characteristics of the No Build, TSM/BRT and LPA are described below and include:

- Travel Time
- Access to Jobs
- Reliability and Safety
- Local Roads
- 95th Street Station Bus Capacity and Delay

6.3.1 Travel Time

Overall travel time has been calculated for the LPA, TSM/BRT, and No Build alternatives, as shown in Table 6.4. These travel time estimates include wait time, run time (in-vehicle), and walk time.

Table 6.4: Estimated Travel Times from 130th Street to Jackson Blvd.

Travel Time Elements	Time in Minutes		
	No Build	TSM/BRT	LPA
Wait time at 130th Station	3.50	2.25	2.25
Run time 130th to 95th Stations	28.00	23.00	14.00
Walk time: curb to platform	3.00	3.00	0.0
Wait time at 95th Station	2.25	2.25	0.0
Rail run time 95th to Jackson Station	25.00	25.00	25.00
Total Travel Time	61.75	55.50	41.25

As shown in Table 6.4, the travel time for the No Build Alternative is 62 minutes from 130th Street to the downtown Jackson station. This represents the existing travel time using route #34 South Michigan to 95th Street with a transfer to Red Line. Travel times for the TSM/BRT Alternative are expected to improve by five minutes or 56 minutes, but would still require a transfer to the Red Line. Overall, the LPA provides the fastest travel time at 41 minutes. Trips to Jackson would be improved by 21 and 14 minutes over the No Build and TSM/BRT, respectively.

6.3.2 Access to Jobs

The LPA would provide increased access to jobs within Chicago and 40 adjacent suburbs using the CTA transit system. Park-and-ride facilities for automobile access would be located at 103rd, 111th, 115th and 130th Streets for the TSM/BRT and LPA. The 130th Street park-and-ride facility would be near the I-94 Bishop Ford Freeway/130th Street interchange. This location is expected to draw a significant number of automobile commuters from the southern suburbs and northwest Indiana who would want to avoid congestion and travel delays further north along the Dan Ryan Expressway. Table 6.5 shows the estimated number of parking spaces for the LPA and TSM/BRT alternative for a 2015 year of construction (YOC) and 2030 forecast.

Table 6.5: Parking Spaces for 2015 and 2030

Location	TSM/BRT		LPA	
	2015	2030	2015	2030
103rd Street	100	200	200	200
111th Street	100	200	200	200
115th Street	100	1000	200	1000
130th Street	400	1400	900	2300
Total	**700**	**2800**	**1500**	**3700**

Table 6.6 shows the approximate number of transfers required for a transit trip from various origin areas in the study area to two major regional job centers: downtown Chicago and the O'Hare Airport / Rosemont area. The trips are considered during peak hour with a possible Blue Line and/or bus connection for O'Hare / Rosemont area trips. Overall, The LPA requires fewer transfers compared to No Build and TSM/BRT alternatives for these trips. Roseland Community Hospital (111th Street), Michigan commercial and retail corridor (115th Street and Michigan Avenue) and Altgeld Gardens (130th Street) would have walk to transit access to the stops/stations for the TSM/BRT and LPA. Compared to the LPA, the No Build and TSM/BRT would require a transfer from bus to rail at 95th Street to reach the Chicago Loop and additional 1-2 transfers to reach the O'Hare / Rosemont employment area.

Table 6.6: Number of Transfers between Select Origin-Destination Pairs

Number of Transfers Required	No Build	Michigan TSM/BRT	LPA HRT UPRR
Chicago Loop			
Altgeld Gardens	1	1	0
Pullman Library	1	1	1
Halsted Commercial / Retail	1	1	1
Michigan Commercial / Retail	1	1	0
Roseland Community Hospital	1	1	0
Chicago State University	1	1	1
Olive-Harvey College	1	1	1
Rosemont / O'Hare Area Employment			
Altgeld Gardens	2 - 3	2 - 3	1 - 2
Pullman Library	2 - 3	2 - 3	2 - 3
Halsted Commercial / Retail area	2 - 3	2 - 3	2 - 3
Michigan Commercial / Retail area	2 - 3	2 - 3	1 - 2
Roseland Community Hospital	2 - 3	2 - 3	1 - 2
Chicago State University	2 - 3	2 - 3	2 - 3
Olive-Harvey College	2 - 3	2 - 3	2 - 3

6.3.3 Reliability and Safety

Increased transportation reliability is evaluated by assessing impact of alternatives on operating reliability. The TSM/BRT alternative would utilize transit signal priority to improve overall travel time to 95th Street. However, the TSM/BRT alternative is expected to have a moderate operating reliability due to operation in mixed traffic along Michigan Avenue. The LPA would operate on an elevated guideway and achieve high operating reliability similar to existing Red Line service.

Table 6.7: Reliability and Safety

Criteria	No Build	TSM/BRT	LPA
Operating Reliability	N/A	Moderate	High
Potential Impact on Emergency Vehicle Incident Response Capability	N/A	Moderate/Low	Low
Enhance safety and security	N/A	Moderate	Moderate

In regards to safety, improving incident response was examined by evaluating the potential impact on emergency vehicle response capabilities. The TSM/BRT alternative could potentially have low to moderate impacts on emergency response vehicles due to signal priority conflicts which would ultimately go to emergency vehicles. TSM/BRT would operate in mixed traffic and would contribute to the normal traffic delay experienced during incident response. The LPA would be grade-separated and would not impact the ability of emergency vehicles to operate.

The LPA and TSM/BRT can incorporate design elements that enhance safety and security in preliminary engineering and final design. A wide range of safety measures will be identified, evaluated, and used in combination. These include vehicle measures (on-board closed-circuit television cameras, on-board audio and visual message communications to passengers, and emergency alarm systems), and station design (maximizing unobstructed sightlines in and surrounding stations, positioning of customer service booth for maximum presence and visibility in station, closed-circuit television cameras, public address systems, sufficient lighting, and emergency alarm systems). Traffic safety was measured using the criteria of the number potential conflict points with vehicles, pedestrians and bicycles. TSM/BRT alternative has the most number of conflict points with general traffic. Alternately, the LPA, due to the grade separation, has no conflict points with general traffic, but there are potential pedestrian conflicts with the freight railroad line for customers accessing the proposed 103rd and 111th Street stations. Mitigation measures, including pedestrian bridges, will be analyzed during Preliminary Engineering and preparation of an EIS.

6.3.4 Ridership

Ridership estimates for the year 2030 were developed using computerized travel forecasting models. The LPA exhibits strong ridership potential, while the TSM/BRT alternative is expected to only have a slight increase over the No Build alternative. By 2030, the LPA is expected to carry 13 million riders per year. For the TSM/BRT alternative, approximately one million riders are projected. Table 6.8 shows estimated weekday ridership for each station in 2030.

Table 6.8: Estimated 2030 Average Weekday Station Boardings

Station	No Build	TSM/BRT	LPA
103rd Street	N/A	500	5,100
111th Street	N/A	800	4,800
115th Street	N/A	100	6,900
130th Street	N/A	400	4,400

For consistency with other proposed rail extensions, total project ridership includes customers entering and exiting new stations as well as the volume traveling south of 95th Street Station on the extension. Year 2030 total project ridership is estimated at 42,000 per weekday or 13 million riders per year.

6.3.5 Local Roads

The impact on local roads was evaluated based on the level of traffic impediments. The LPA is proposed with full grade separation via an aerial structure and thus has a low level of potential traffic impediments. The TSM/BRT alternative operates at-grade in mixed flow traffic and has a moderate level of local roadway impacts.

The TSM/BRT Alternative would utilize traffic signal priority (TSP) at signalized intersections along 95th Street, Michigan Avenue, and 130th Street to improve running times. TSP improvements can be implemented to avoid negatively impact traffic level of service. However, the TSM/BRT alternative may require removal on street parking along Michigan Avenue in order to reduce improve level of service if warranted.

The LPA is elevated from 95th Street to the MED/CN tracks near 119th Street. The alignment then continues at -grade through an industrial area with no public through streets. Existing service drives and MWRDGC access roads would be grade separated.

The potential exists for Union Pacific freight railroad trains to affect access to the LPA at the proposed 103rd Street and 111th Street stations. At these two stations areas, the Union Pacific Railroad is at-grade, so that passing freight railroad trains would interrupt access to these Red Line Extension stations. Opportunities for pedestrian bridges will be analyzed in subsequent project steps. At the 115th Street/Michigan Avenue station, the Union Pacific Railroad is grade separated, so that access to the Red Line Extension station can be maintained by using Michigan Avenue, which passes underneath the Union Pacific Railroad.

The LPA would also require a new bus turnaround at 115th/Michigan in order to terminate CTA route #119 Michigan/119th. If an off-street turnaround is provided, it will require approximately 20,000 square feet, depending upon design.

Table 6.9: Traffic Impediments

Criteria	No Build	TSM/BRT	LPA
Potential corridor impacts	N/A	Moderate	Low
103rd, 115th and 130th Station area impacts	N/A	Low	Low-Moderate
95th Street Station area impacts	High	High	Low
Potential Displaced On-Street Parking Spaces	N/A	Moderate	Low

6.3.6 95th Street Station Bus Capacity and Delay

The LPA is expected to significantly improve bus and passenger congestion at the 95th Street station. The No Build and TSM/BRT Alternatives are expected to result in increased passenger traffic at the 95th Street station in 2030. Table 6.9 shows the current and forecasted annual ridership at the 95th Street station for the No Build, TSM/BRT and LPA. Under the No Build ridership is expected to increase by 0.4 Million in 2030.

Table 6.10: Annual 95th Street Station Ridership (in millions)

Ridership	Current Red Line (2007)	No Build (2030)	TSM/BRT (2030)	LPA (2030)
95th Street Station	9.1	9.5	9.8	4.3

Currently, nineteen CTA and Pace bus routes utilize the 95th terminal. The LPA will result in the re-routing of 11 bus routes to new Red Line Extension intermediate stations and elimination of two routes, thus relieving congestion at the 95th Street station.

The TSM/BRT alternative would include in one additional bus route and expansion of the 95th Street station bus terminal to provide additional bus bays and circulation improvements. The capital cost for this improvement is estimated at $73 M.

6.4 LPA Environmental Characteristics

The environmental characteristics of the LPA are based upon currently available information. The Environmental Impact Statement (EIS) process will be conducted for the LPA, and will assess the environmental impacts in more detail. Applicable environmental requirements and communications between the regulatory and resources agencies and the local project sponsor will be part of the EIS process.

Environmental characteristics of the No Build, TSM/BRT, and the LPA examined include:

- Social Equity / Neighborhoods
- Land Use and Development
- Displacements
- Visual and Aesthetic
- Noise and Vibration
- Air Quality

- Water and Ecosystem Resources
- Hazardous Waste Sites
- Historic, Archaeological and Cultural
- Parklands

6.4.1 Social Equity / Neighborhoods

Transit Dependent Populations

The location of transit-dependent populations is a measure of the potential for an alternative to better serve a core transit market. The following series of maps illustrates characteristics associated with transit dependent populations including: age distribution, low income households, and the number of no-vehicles households in relationship to the LPA.

Figure 6.2 illustrates the concentration of residents over the age of 65 and Figure 6.3 shows under the age of 18. The young and elderly have reduced access to personal vehicles and rely more on public transit.

Figure 6.4 shows areas where low income households are found relative to proposed station locations. Lower income households are more likely to rely on public transportation as a primary mode of transportation. See also Table 6.11.

Table 6.11: Poverty Status and Zero-Car Households within ½-Mile Station Areas

Criteria	No Build	TSM/BRT	LPA
2000 Poverty-Status Population	N/A	9,696	8,473
2000 Zero Car Households	N/A	2,991	2,336

Table 6.11 and Figure 6.5 provide data on households that report not owning a vehicle. These households are more likely to rely on public transportation as their primary mode of travel.

In general, the LPA serves the transit dependent populations in the study area, especially in the Roseland, southeast Washington Heights, and northeast West Pullman community areas and the Altgeld Gardens area.

6.4.2 Land Use and Development

The LPA is expected to have the greatest potential for future economic development. This is due to enhanced accessibility of station areas to the CTA rapid transit system compared to the No-Build and TSM alternatives. Altgeld Gardens and Murray Homes are under physical rehabilitation as part of the Chicago Housing Authority's Plan for Transformation, indicating a commitment to the residents and potential for additional economic development in the area.

Other opportunities exist at the 103rd Street station and at the 115th Street/Michigan Avenue area. The 103rd Street station area has a number of vacant and underutilized lots that can be redeveloped in response to the new station. The 115th Street / Michigan Avenue area is part of the Roseland/Michigan TIF which created a potential funding source for economic development in the area, and the City owns a number of parcels near the proposed station area that are being reviewed for potential commercial or mixed-use redevelopment.

Figure 6.6 shows land use relative to the LPA and station areas within the Study Area.

6.4.3 Displacements

The LPA would be located adjacent to the east or west edge of the UPRR right-of-way. The width of the UPRR right-of-way ranges from 65 to 135 feet. At this stage of the analysis both the east and west options suggest comparative level of impacts with no option having better or worse physical constraints. There are several key differences that characterize physical constraints for the east or west alignment of the LPA between I-57 and the Metra Electric District / Canadian National rail tracks.

- The East alignment may require taking a small portion of Wendell Smith Park when the alignment transitions from the I-57 expressway to the east side of the UPRR right-of-way. This would require a Section 4(f) evaluation during the Environmental Impact Statement analysis.
- A small portion of a yard belonging to the Roseland Christian School (314 West 108th Street) may be impacted by the east side alignment.
- On the east, between I-57 and 103rd Street there are five vacant and 17 residential parcels that would be impacted by the Red Line extension; from 103rd and 111th Street there are 18 vacant, nine residential and two commercial/industrial parcels that would be impacted; and between 111th Street and the Metra Electric District/Canadian National rail tracks there are 30 vacant, 39 residential and 16 commercial/industrial parcels that would be affected. A preliminary analysis shows a potential total of 138 lots which may be affected, with ten parcels owned by the Union Pacific Railroad.
- For the West option, Fernwood Parkway extends between 95th and 103rd Streets between Eggelston Avenue and the UPRR right-of-way. The west alignment option can be accommodated without displacement of residences or businesses in this segment if the alignment uses Fernwood Parkway. However, the parkway is owned by the Chicago Parks Department and is zoned as “Parks and Open Space” as of May 2009. Using this property for the HRT UPRR Elevated alternative would require a Section 4(f) evaluation as part of the Environmental Impact Statement review.
- On the west, between 103rd and 111th Street there are 15 vacant and 18 commercial/ industrial parcels that would be impacted by the Red Line extension; between 111th Street and the Metra Electric District /Canadian National rail tracks there are 28 vacant, 25 residential and 22 commercial/industrial parcels that would be impacted. A preliminary analysis shows a total of 112 impacted parcels of which 27 parcels are owned by the Union Pacific Railroad and four are Fernwood Parkway.

6.4.4 Visual and Aesthetic

The LPA is deemed to have a moderate potential visual and aesthetic impact. The LPA received this rating because of the elevated profile. This impact is somewhat mitigated by the lack of frontage along the UPRR corridor. Figure 6.7 is example rendering of the LPA elevated structure adjacent to the UPRR ROW at the proposed 103rd Street Station. The elevated structure would be constructed of concrete with side walls in order reduce visual and noise impacts of the HRT alignment. This is similar in design and construction to the existing Orange Line elevated structure southwest of Halsted Street. Figure 6.8 illustrates of profile view of the LPA elevated structure adjacent to the UPRR ROW.

6.4.5 Noise and Vibration

A generalized noise and vibration analysis for the TSM/BRT and LPA was performed. Implementation of the proposed TSM/BRT service may add 5 decibel on the A-weighted sound level (dBA) to the noise environment experienced by residents. There is existing vehicular traffic and bus service along the proposed corridor, although the new TSM/BRT service is estimated to increase ambient noise by 5 dBA for noise receptors.

The LPA is estimated to increase ambient noise by 8 dBA, from 65 dBA to 73 dBA, for the residences closest to the right-of-way. A city bus idling is approximately at 72 dBA. It should be noted that the existing freight rail service also results in similar noise impacts. The UPRR corridor is currently an active freight rail line, with an average of 27 trains per day. Because of the existing freight rail service in the corridor, sensitive receptors along the alignment are likely to experience a higher level of noise that residential areas without a similar transportation facility.

For the LPA, the CTA will evaluate and use a combination of noise abatement measures, as necessary. These measures could include rail vehicle measures (vehicle skirts, undercar absorption, and resilient or damped wheels), and guideway measures (sound barriers, rail lubrication on sharp curves, and ballasted track).

Vibration impacts are typically analyzed in terms of ground-borne vibration. Vibration occurs for rail transit when the train wheels rolling on the rails create vibration energy that is transmitted through the track support system into the transit structure. The amount of energy that is transmitted to the transit structure is dependent on a number of factors including the type of track support system, the vehicle suspension system, and smoothness of the wheels and rail. Screening level estimates for vibration for the LPA range from 58-62 vibration decibels (VdB). In general, 65 VdB is the approximate threshold of human perception.

For the LPA, the CTA will evaluate and use a combination of vibration abatement measures, as necessary. The type of track support system is a major determinant of ground borne vibration. The highest vibration levels are created by track that is rigidly attached to a concrete trackbed. The vibration levels are much lower when special vibration control track systems, such as ballasted mats and resilient fasteners are used.

6.4.6 Air Quality

Northeastern Illinois is classified as a moderate non-attainment area for the 8-hour ozone standard, and a non-attainment area for the annual fine particulate matter (PM2.5) standard. Air quality was assessed through the potential for micro-scale pollution.

The LPA includes heavy rail transit technology that is powered by electricity, which does not emit gases or particulate matter at the point of use. In addition, the LPA reduces the length of bus access trips, resulting in a reduction of emissions.

Buses used for the TSM/BRT service, or continued use of existing buses in the case of No-Build alternative, would have more adverse impact than the LPA, due to diesel exhaust. CTA is incorporating hybrid buses into its fleet to mitigate this impact, but the LPA would still have lower air quality impacts.

6.4.7 Water and Ecosystem Resources

The Red Line Extension study area is an urbanized area. Wetlands and critical habitat for protected species in the area were assessed for potential impacts. Waters in the area – the Cal-Sag Channel and the Little Calumet River – were not evaluated for impacts, such as non-point source pollution, and should be considered during the EIS review. Assessing potential environmental impacts to the natural environment provides information that can be used to limit or reduce the negative impacts of an alternative, if any.

During the screening analysis, the LPA was identified to have five wetlands within a 1,000 foot wide corridor around the alignment. The five wetlands are located on industrial or MWRDGC land on the southern portion of the alignment between the MED/CN tracks and 130th Street. Further review of the LPA corridor showed that most of the wetlands were on the outer edge of the corridor and would only have a slight chance of being negatively affected. The TSM/BRT was identified to have one wetland with 1,000 foot wide corridor around the alignment. The

TSM/BRT and LPA terminal station locations are situated in land areas adjacent to 130th Street that are landscaped and profiled for drainage.

Mitigation could be employed to protect or replace these wetlands. In addition, field studies during the upcoming EIS process will be completed to verify that these wetlands are still in existence and the potential impact that may occur based on the final design of the chosen alternative.

6.4.8 Hazardous Waste Sites

As part of its history, the Red Line Extension study area includes a high concentration of industrial and former industrial sites. One of the legacies of previous industrial processes is the potential for hazardous waste sites. These sites can include:

- Brownfields, which are abandoned or underutilized industrial facilities and land
- Waste handlers, which can include any facility that deals with toxic chemicals
- Superfund sites, which are deemed to be the worst brownfields, and are on a priority list for being cleaned by the U.S. Environmental Protection Agency
- Other sites, which can include active industrial sites or commercial properties, such as gas stations with leaking underground storage tanks (LUST)

Identifying these sites is important for two reasons: clean-up of a site can be costly, adding to the overall cost of an alternative, and reusing a site can have positive environmental benefits for a community.

There are 18 hazardous waste handlers and three other hazardous waste sites within 500 feet of TSM/BRT route along Michigan Avenue. However, the alternative does not require widening of Michigan Avenue, as service was anticipated to be provided in the existing street right-of-way; it is unlikely that these sites would be disturbed.

There are four hazardous waste handlers and three other hazardous waste sites within 500 feet of the LPA corridor.

6.4.9 Historic, Archaeological and Cultural

An analysis of historic, archaeological and cultural sites is important to ensure that the AA considers and respects a community's context and identity. Historic, archaeological and cultural sites within a 500 foot buffer from the centerline of each corridor were identified in Screen 2 and 3. The analysis determined that there was low potential for impacts to archeological sites with the proposed corridors. There were also no historic buildings or districts within a 500 foot buffer.

6.4.10 Parklands

There are two parklands that may be affected by the LPA. They include Fernwood Parkway, along the west side of the UPRR right-of-way and Wendall Smith Park, to the east of the UPRR right-of-way. The TSM/BRT and No-Build alternatives were determined to not have any impacts to park land.

The LPA west alignment would affect the portion of Fernwood Park that parallels the UPRR right-of-way from I-57 to 103rd Street. This linear park, about 75 to 80 feet wide and 0.5 mile long, would be impacted by the Red Line extension. Wendall Smith Park, along the east, is approximately 500 feet long and 260 to 270 feet wide. About 50 feet of the park adjacent to the

UPRR right-of-way would need to be used to accommodate the Red Line extension. Aerial photography shows trees and other vegetation in this area, separated from the other portions of the park by a sidewalk.

No natural recreational areas were found in any of the corridors during the environmental analysis.

6.4.11 Summary of Environmental Impacts

Table 6.13 below provides a summary of the potential environmental impacts for the LPA and TSM/BRT alternative. For additional detail on the preliminary environmental impacts for each alternative see the Red Line Extension Screen 3 Alternatives Evaluation Report, July 2009.

Table 6.13: Summary of Potential Environmental Impacts

Environmental Factors	TSM/BRT	LPA
Hazardous Sites: Brownfields	0	0
Hazardous Sites: Waste Handlers	18	4
Hazardous Sites: Superfund Sites	0	0
Hazardous Sites: Others	3	3
Wetlands	1	5
Historic Districts	Low	Low
Potential Micro Scale Pollution	Moderate	Low
Potential Noise Impact	+5 dBA	+8 dBA
Potential Vibration Impact	N/A	58-62 VdB
Potential Visual Impacts	Low	Moderate
Parklands Impacted	1	5
Recreation Areas Impacted	0	0
Total Parcels impacted	0	112-139
Vacant Parcels impacted	0	43-53
Critical Habitat Impacts to Protected Species	0	0
Potential for Archaeological Site Impacts within the Proposed ROW	Low	Low
Buildings Listed or Eligible for Listing in the NRHP Within 200’	0	0
Districts Listed or Eligible for Listing in the NRHP Within 200’	0	0

6.5 LPA Cost and Financial Analysis

A description of the capital and operating and maintenance cost estimates for the LPA and a preliminary financial analysis is presented in this section.

6.5.1 Capital Cost Estimates

Capital cost estimates have been developed in accordance with FTA guidelines. The guidelines call for cost estimates to be prepared and reported using the latest revision of FTA's Standard Cost Categories (SCC). In the estimates, cost components for the various alternatives are developed and summarized into the SCC. These cost categories form the basis for the format and structure that is used for the capital cost detail and summary sheets developed for this project. The FTA SCC consists of the following:

- Guideway
- Stations
- Support Facilities
- Sitework and Special Conditions
- Systems
- Right-of-Way, Land, Existing Improvements
- Vehicles
- Professional Services
- Allocated and Unallocated Contingency
- Finance Charges

Table 6.14: LPA Capital Cost ($M, 2009)

FTA Standard Cost Categories (with contingency)[10]	LPA 5.4 Miles
Guideways & Track Elements	180
Stations, Terminals, Stops	154
Yards, Shops, Administration Buildings.	-
Sitework & Special Conditions	21
Systems	128
Right-of-Way, Land Acquisition	32
Vehicles	175
Professional Services	139
Unallocated Contingency	50
Total Project Cost	**879**
Capital Cost per Route Miles	**163**

---

[10] An allocated contingency allowance, in the range of 12 percent to 25 percent, is included in the FTA standard cost categories.

Design alternatives exist and are described in Section 6.2. For the capital cost estimates in this section, the UPRR East Options to 130th Street with the South Terminal Station was assumed. Major capital cost elements for the LPA include the following:

- One at-grade terminal station with island and side platforms to serve three station tracks: $25 M.
- Three elevated profile intermediate, island-platform stations: $94 M.
- Construction of parking facilities at the intermediate and terminal stations with a year of construction total of all facilities at 1,500 parking spaces (Forecast for 2030 is 3700 parking spaces): $35 M.
- Construction of an aerial guide way structure from 95th Street to 119th Street: $149 M.
- Temporary facilities and protection of active lines adjacent to construction zones (includes CTA and UPRR lines): $6.0 M.
- Land acquisition for the extension, stations and amenities, terminal facilities, on-line substations: $32.0 M.
- Construction of realigned service roads and new overpass over UPRR red line extension for the south station: $4 M.
- Purchase of 78 new rapid transit cars: $175 M.

Yard and Shop Capital Cost Estimate

Completion of a new 270-car yard and shop facility is not included in the LPA project cost estimate. The CTA has long recognized 98th Shop as being an inadequate facility to support the current and future maintenance needs of the south end of the Red Line and have included the need for an expanded or new 98th Shop in past capital needs programs. With the shop reaching 40 years in age, the shop has also met the FTA criteria for replacement. The CTA has plans to utilize existing 98th Shop for non-revenue equipment repairs once a new revenue shop is constructed. The CTA has previously determined that the 98th Shop is in need of replacement and has made plans separate from this project to address those needs. For that reason, the replacement of 98th Shop is not considered to be part of the Red Line Extension project at this stage of the analysis. More detailed analysis in latter project phases should indicate that a portion of the yard and shop cost would be applicable to the LPA. A new Red Line yard/shop facility would be located on a combination of industrial/vacant land to the east of the CN/MED tracks and west of the IHB and NICTD tracks at approximately 120th Street and Cottage Grove.

Major capital cost elements for construction of new Yard and Shop include the following:

- Construction of yard and shop: $147 M.
- Purchase of real estate: $11 M.
- Professional services for design and construction: $45 M.
- Unallocated contingency: $12 M.
- Total capital cost for a new yard and shop facility is estimated at $215 M.

Total Program Capital Cost Estimate

To prepare a preliminary financial plan for the Red Line Extension project, a total program cost was developed. The program is divided into a New Starts funded and non-New Starts funded segments. The non-New Starts funded segment consists of the yard and shop facility to be funded outside the New Starts program. The total program cost also includes estimates of inflation in construction costs and expressed in year-of-expenditure (inflated dollars). The total program cost in inflated dollars is estimated at $1.4 billion as shown in Table 6.15.

Table 6.15: Program Capital Cost Estimates ($M)

Segment	Base Year (2009) Dollars	Year-of-Expenditure (Inflated) Dollars
New Starts funded segment	$878	$1,142
Non-New Starts funded segment	$214	$287
Total	**$1,093**	**$1,430**

6.5.2 Operating and Maintenance Cost Estimates

Operating & Maintenance (O&M) costs were estimated using CTA's operating cost model, which is based on actual line item budget expenses. The cost model allocates each budget line item expense to a key service variable such as revenue hours, revenue miles, peak vehicles, route miles, etc. These variables are called "cost drivers" because the cost of service is "driven" by the magnitude of these variables. Thus, the more service hours provided or miles operated, the higher the O&M cost. Estimated annual operating cost for the LPA is $18.3 million in 2009 dollars. Table 6.16 summarizes the O&M costs for the LPA.

Table 6.16: LPA Operating and Maintenance Costs

Cost Driver	Unit Cost (2009 Dollars)	Level of Service	O&M Cost (2009 Dollars)
Rail			
Peak Trains	$131,552.79	8	$1,052,422
Peak Cars	$26,364.48	64	$1,687,327
Revenue Train Hours	$76.54	37,227	$2,849,192
Revenue Car Miles	$1.38	5,489,502	$7,570,895
Station Hours	$33.84	35,040	$1,185,819
Stations			
Elevated*	$304,556.80	4	$1,218,227
Track Miles			
Elevated	$118,840.61	10.6	$1,259,710
Substations	$62,969.30	1	$62,969
Fare Collection Equipment	$6,730.92	29	$195,197
Elevators/Escalators	$23,027.68	8	$184,221
Yard/Shop (per sq. foot)	$4.75		$0
Park & Ride (per space)	$521.46	2,800	$1,460,086
Rail Ridership	$0.05	7,708,106	$399,154
Bus			
Peak Buses	$34,587	6	$207,516
Revenue Bus Miles	$2.75	(276,451)	($759,439)
Revenue Bus Hours	$44.80	(3,991)	($178,762)
Turnarounds	$15,341	5	$76,703
Bus Stops	$14.14		$0
Bus Ridership	$0.05	(3,083,242)	($159,662)
Total O&M Cost (Base Year (2009) Dollars)			**$18,311,575**

* Station Unit Cost is an aggregated unit cost in CTA O&M cost model

6.5.3 Capital Funding Sources

CTA has identified the following preliminary capital funding sources for the LPA:

- *Federal New Starts Program (Section 5309)*: A federal match of 60 percent was assumed on the federally funded portion of the Project. Receipt of New Starts grant funds is assumed to commence in FY11 and is assumed to be subject to an annual cap of $150 million annually.
- *State Funds:* State funds are assumed to defray the remaining share of capital costs not covered by federal New Starts grants. This includes 40 percent of the cost of the federally funded portion of the project, and 100 percent of the non-federally funded portion of the project. Both portions total an estimated at $774 million. To date, however, no state funds have been identified or committed for this purpose. Therefore, there is presently a capital funding shortfall equal to the projected state funding share in the financial plan. On July 13, 2009, a $31 billion State capital bill, *Illinois Jobs Now!,* was signed into law. This bill provides $2.7 billion for the six-county northeastern Illinois region for bringing the transit system to a state of good repair. This capital bill is indicative of the State's commitment to funding public transportation investments and CTA will continue to advocate for additional funds in subsequent capital bills.

In addition, the financial plan includes federal transit formula grants that CTA is projected to receive from operating the incremental transit service associated with the project:

- Section 5309 Rail and Fixed Guideway Modernization Program, which grows as a function of fixed guideway directional route-miles and fixed guideway vehicle revenue-miles.
- Section 5307 Large Urban Cities Program, which grows as a function of demographic measures (population and population density, adjusted three years after each decennial census); level of service (vehicle revenue-miles and fixed guideway directional route-miles); and an incentive funding measure (passenger miles x passenger miles/operating cost)

These funds are applied toward future year infrastructure renewal and replacement costs associated with the LPA. These grant programs are subject to review and revision by Congress as part of surface transportation authorization legislation every six years, and could be altered in the future.

Projected future-year unit grant values are multiplied by projections of applicable transit service characteristics for the project (e.g., revenue vehicle miles, fixed guideway directional route miles, passenger miles, and operating costs). The resulting projection of incremental federal formula grants for the LPA in the design year (2030) is $6.6 million (2009 dollars).

Other federal funding program sources in the financial plan include:

- Section 9 (5307) Congestion Mitigation and Air Quality Program: Federal formula grants for transportation projects that reduce criteria air pollutants regulated from transportation-related sources in National Ambient Air Quality Standards nonattainment areas. Fixed funding of $4.0 million annually beginning in FY10, based on historic average funding levels.
- Job Access and Reverse Commute Program: A federal formula grant program to address the unique transportation challenges faced by welfare recipients and low-income persons seeking to get and keep jobs. One-time funding applied in FY09.
- Homeland Security/Department of Justice Grants: Federal formula grants for transit security improvements. Fixed funding of $6.5 million annually beginning in FY09, based on historic average funding levels.

6.5.4 O&M Funding Sources

CTA O&M funding sources include passenger revenue, public funding, system generated revenue, and additional public funding. Passenger revenue reflects the fares received from customers. Projected fare revenue for the proposed Red Line Extension LPA is a function of projected passengers and projected average fare paid per passenger. It is expected that $8.4 million (2009 dollars) in fare revenue will result in 2030 due to implementation of the Red Line Extension project.

Public funding includes sales tax and discretionary funding from the 1983 Regional Transportation Authority (RTA) Act, and new funding from the 2008 legislation.

- **Sales Tax (1983 Formula):** The RTA Sales Tax authorized in 1983 is the primary source of operating revenue for CTA. The tax is authorized by Illinois statute, imposed by the RTA in the six-county region of northeastern Illinois and collected by the State.

The sales tax is the equivalent of 1 percent on sales in Cook County and 0.25 percent on sales in the collar counties of DuPage, Kane, Lake, McHenry and Will. The 1 percent sales tax in Cook County is comprised of 1 percent on food and drugs and 0.75 percent from all other sales, with the State then providing a "replacement" amount to the RTA equivalent to 0.25 percent of all other sales. CTA receives 100 percent of the taxes collected in the City of Chicago and 30 percent of those collected in suburban Cook County, after the RTA retains its 15.0 percent share. Revenues are projected to grow beyond FY09 based on a projection of Cook County sales tax revenue developed for CTA by Moody's Economy.com.

- **Sales Tax and Public Transportation Fund (PTF):** RTA sales tax increased by the enactment of PL (P.A. 95-0708) in January 2008 equivalent to a 0.25 percent on sales in each county in the six-county region. By statute, 100 percent of the sales tax receipts and PTF funds, excluding the 25 percent PTF on Real Estate Transfer Tax (RETT) which goes to the CTA, are disbursed by formula to the Service Boards after setting aside funds for ADA paratransit service, suburban mobility, and for innovation, coordination, and enhancement (ICE). Funding for these three initiatives increase or decrease annually based on the percent change in the previous year's receipts from taxes imposed by PL (P.A. 95-0708) under Section 4.03. The RTA deposits funds each year into an ICE fund as directed by Section 4.03.3 of PL. ICE funds may be used by the RTA based on the affirmative vote of 12 RTA Directors for operating or capital grants or loans to Service Boards, transportation agencies, or units of local government that advance the goals and objectives of the RTA Strategic Plan. This funding is projected to grow on the basis of projected growth in sales and real estate transfer taxes in the six-county region.
- **RTA Discretionary:** Apportionment from RTA's 15 percent share of the sales tax (1983 Formula) and the State Public Transportation Fund (PTF) equal to 25 percent of the sales tax (1983 Formula) are the source of the RTA discretionary fund. This funding is projected to grow on the basis of projected growth in sales tax in the six-county region.
- **Real Estate Transfer Tax – RTA Formula:** As authorized by the 2008 Legislation (P.A. 95-0708), CTA receives the portion of PTF revenue earned from real estate transfer taxes. This funding is projected to grow on the basis of projected growth in Cook County real estate transfer taxes.
- **Real Estate Transfer Tax – City of Chicago:** In addition to the PTF real estate transfer tax revenue, the 2008 Legislation (P.A. 95-0708) authorized CTA to receive funds at a tax rate of 0.3 percent on real estate transfers in the City of Chicago. This funding is projected to grow on the basis of projected growth in Cook County real estate transfer taxes.

System generated revenue includes:

- **Reduced Fare Subsidy:** The reduced-fare subsidy is the State of Illinois reimbursement to CTA for discounted fares to seniors, people with disabilities and students. This revenue source is projected to grow with inflation.
- **Advertising, Charter, and Concessions:** Includes revenue from advertising, charter transit service, and concessions on CTA property. This revenue source is projected to grow with inflation.
- **Investment Income:** Interest income on CTA fund balances. Calculated annually in the financial plan on the basis projected cash balances. Applies a forecast of three-month U.S. Treasury Bills as the interest rate.

- **Statutory Required Contributions:** The Regional Transportation Authority Act requires the City of Chicago and Cook County to contribute $3.0 million and $2.0 million, respectively, towards CTA operations each year. This amount is projected to remain fixed at $5.0 million annually.
- **All Other Revenue:** Includes parking fees, sale of real estate and rentals. This revenue source is projected to grow with inflation.

6.5.5 Capital and Operating Shortfalls

Additional Revenue Sources

Additional revenue sources must be identified to address projected CTA and Red Line Extension project-specific shortfalls. A state-supplied funding source or mixture of multiple sources to address capital and operating shortfalls has not yet been identified by the State of Illinois or the RTA.

Risks and Uncertainties

As the Red Line Extension project progresses, there are several strategies that CTA could utilize to address these risks, if one or more should occur. These strategies include:

- Further staging the construction of the project;
- Controlling the growth of service;
- Raising fares at a higher annualized rate and/or more often;
- Redefining the scope of the project; and
- Introducing additional short and long term financing strategies.

Implementation

Based on the funding shortfalls identified above, CTA is developing a strategy to fund the capital and operating needs of the LPA. Overall, the strategy assumes that 60 percent of the project capital cost would be funded by FTA Section 5309 New Starts grants, with the remainder covered by state funding. CTA and the RTA are working with the Illinois Department of Transportation and relevant committees of the state legislature to identify stable and reliable sources of funding to fully fund operations and maintenance of existing services, renewal existing infrastructure, and fund the operations, maintenance, and eventual infrastructure renewal of capacity expansion projects, including the Red Line extension project.

As the Red Line Extension project progresses through the project development process, CTA will work with its funding partners to further develop and refine this funding strategy, which would ultimately form the basis of a Full Funding Grant Agreement between CTA and FTA.

6.6 LPA Achievement of Project Goals and Objectives

Five goals were identified for the Red Line Extension AA. Specific criteria and measures were developed for each goal as a means of assessing whether an alternative meets the goal. Figure 6.9 depicts how the LPA achieves these goals and objectives. These include:

Goal 1 – Regional and Local Access Mobility

The purpose of the Red Line Extension Alternatives Analysis (AA) Study is to identify transit improvements that would provide improved mobility to residents and businesses located in the City of Chicago's Far South area.

To evaluate this goal, the number of residents with access to high quality, convenient, and reliable transit service was estimated. The LPA provides access to a high number of residents. According to 2000 U.S. Census data, there are a total of 54,000 people and 19,000 households in the UPRR corridor. Nearly 59 percent (32,000) of the corridor population is within 0.25 miles of the station areas.

The Red Line Extension would provide connections with the other CTA rail rapid transit lines at transfer stations (Roosevelt, Jackson, Lake, Fullerton, and Belmont stations). The new Red Line Extension stations would include bus terminals for CTA and Pace bus transfers. The opportunity exists to construct a new transfer station to the NICTD South Shore Commuter Rail Line in the vicinity of the proposed Red Line Extension 130th Street station. This potential connection to the South Shore would depend on funding availability. The CTA will continue to coordinate with NICTD during the Red Line Extension project development. In addition, the CTA will continue to coordinate with Metra regarding their proposed South-East Service.

Goal 2 – Community and Economic Development

A major aspect of this goal is to locate transit alignments and stations in areas with existing land uses conducive to transit use or in those areas which have the greatest potential to develop transit supportive land uses.

The LPA fits well with the Purpose and Need Report for this project, providing a corridor that connects major neighborhoods and activity centers in the study area. Most of these neighborhoods have been experiencing stable growth and redevelopment in recent years. The City of Chicago Department of Community Development recently approved development plans for a new supermarket and commercial development at 115th Street and Michigan Avenue. An intermodal transit station with bus transfer and park and ride would be located adjacent to this site along the UPRR ROW at 115th Street/Michigan Avenue. The LPA also offers opportunities for development of land surrounding the terminal station at 130th Street and the enhanced potential for economic development activity in conjunction with the renewal of Altgeld Gardens. The LPA is adjacent to five TIF districts and/or enterprise zones and is consistent with local development plans.

The LPA has the highest level of past and current public support.

- In a November 2004, over 38,000 residents of the Red Line extension study area in the 9th and 34th Wards supported a public referendum for the Red Line Extension along the UPRR Corridor. A total of 38,142 'Yes' votes (93%) and 2,993 'No' votes were cast.
- 451 public comments were received in Screens 1, 2 and 3 – 140 of those expressed a preference for a particular alternative. 85 (60.7%) of these comments were in favor of the UPRR Rail alternative and 7 (5%) were in favor of the Halsted Rail alternative. 29 (20.7%) Comments showed general support of an extension of the Red Line, and 19 (13.6%) comments specifically support extending the line to 130th Street with no particular alternative mentioned.
- In June 2009, a petition was submitted to CTA including 512 signatures supporting the CTA's locally preferred route to extend the Red Line Rail Line from the 95th Street Station to 130th Street, using the Union Pacific Rail Road (UPRR) corridor.

Goal 3 – Regional Transit System Performance

This goal ensures that both the capital and operating costs of the project are commensurate with its benefits. The LPA is the most promising alternative to reduce travel times, improve trip reliability, provide sufficient transit capacity to meet 2030 transit demand, maximize potential transit ridership, and to enhance linkages within the CTA and regional transit system.

Based on the Screen 3 analysis, the LPA provides the best opportunity to meet the cost-effectiveness thresholds currently set by FTA. The CTA is seeking approval and funding for construction from the federal government through the Federal Transit Administration's New Starts grant program. In general, projects advancing into the FTA PE phase of project development must achieve a cost-effectiveness measure of below $25 in project cost per hour of travel time savings. The cost-effectiveness of the LPA is expected to be refined during the EIS and PE phase of the project development in order to meet the FTA criteria for New Starts funding.

Goal 4 – Safety and Security

The Red Line extension would increase the safety and security by relieving congestion at the 95th Street station. Several CTA and Pace bus routes that currently serve the 95th Street station would be shortened and re-routed to terminate at 103rd, 111th, 115th and 130th Street. It is anticipated that CTA bus routes 103 – West 103rd Street, 106 – East 103rd Street, 111 – Pullman/111th/115th, 119 – Michigan/119th, and Pace bus routes 348 – Riverdale Connector, 352 – Halsted, and 359 – Robbins/S. Kedzie would be re-routed to serve Red Line Extension stations. These bus re-routings will result in the reduction of current 95th Street station bus terminal congestion, both in terms of the number of bus vehicles serving the station, a reduction in passenger-bus conflicts as passengers walk from the their bus drop-off/pick-up locations to the station house, and the total number of passengers on the station platform.

During the next steps, Preliminary Engineering and the preparation of an EIS, a wide range of safety measures will be identified, evaluated, and used in combination. They include vehicle measures (on-board closed-circuit television cameras, on-board audio and visual message communications to passengers, and emergency alarm systems), and station design (maximizing unobstructed sightlines in and surrounding stations, positioning of customer service booth for maximum presence and visibility in station, closed-circuit television cameras, public address systems, sufficient lighting, and emergency alarm systems).

Goal 5 – Environmental Quality

The fifth goal, Environmental Quality, is to develop solutions which minimize impacts to environmental resources and communities within the study area. The AA identified several potential impacts, including displacements, park lands, and noise and vibration. The next step, the preparation of an EIS will analyze these impacts, as well as the other social, economic, and environmental consequences in detail. The goal of the environmental analysis will be to avoid, minimize and mitigate potential environmental impacts. This environmental review process is required by the National Environmental Policy Act of 1969 (NEPA) and related laws.

Figure 6.9: Effectiveness of Alternatives Meeting Goals and Objectives in 2030

	Goal / Objectives	Evaluation Measures / Criteria	LPA	Notes
Goal 1: Regional and Local Access and Mobility			○	
1	Increase connectivity between and within neighborhoods and activity centers.	Population Served (2000) 31,927	High	Within 0.5 mile of station area
		Population Served (2030) 32,896	High	
		Community Facilities Served	High	
		Community Facilities Impacted	High	Within 500 feet of either side of corridor
		Degree of Potential Effect on Community Facilities	Low-Medium	UPRR West would significantly impact Fernwood Parkway. UPRR East would have low impact on Smith Park
		Employment (2000) 3,114	Medium	Within 0.5 mile of station area
		Employment (2030) 3,694	Medium	
		Service to Activity Centers Within the Study Area	High	Based on alignment and station locations
2	Improve access between city neighborhoods and regional centers, and between suburban communities and the greater central area.	Service to Activity Centers in the Region	High	How well alternatives provide service to activity centers
3	Increase regional transit competitiveness.	Enhancing Linkages and Major Trip Attractors/Generators Within the Region	High	Based on travel forecast with the best improvement in transit trips and reduction in vehicle trips
4	Improve customer transfer connections among regional transit modes.	Quality and Convenience of Trip	High	Number of transfers required and travel time
		Quality of Intermodal Connections	High	Based on quality of intermodal connections
Goal 2: Community and Economic Development			◒	
1	Support community development initiatives.	Consistent with Planned Development and Local Plans	High	Consistent with TIF district, local economic development and housing plans
		Joint Development Potential	Medium-High	
		Potential for Job Creation	Medium-High	
		Public Comments	High	Screen 1,2,3 public comments and public referendum results
2	Provide opportunity for transit-supportive development.	Property Acquisition	Medium-High	Available sites for stations, bus transfer and parking
		TOD Potential	Medium-High	Station area development and market trends
3	Support efficient land use patterns.	Complient with Zoning and Future Land Use	High	Based on City of Chicago planning and development documents
4	Respect community context and identity.	Number of Anticipated Displacements	Low-Medium	Number of displacements required
		Degree of Potential Effect on Neighborhoods	Medium-High	Based on public comments for the alternative
		Effects on Community Cohesion	Medium-High	
5	Promote equitable distribution of project benefits and impacts.	Low-Income or Minority Neighborhoods Served	High	Minority population within 0.5 mile of station area
		Low-Income or Minority Neighborhoods Impacted	Medium	Minority population negatively impacted within 0.5 mile of station area
		Potential for Displacement of Low-Income and Minority Households	Medium	Number of displacements required
		Potential for Displacement of Low-Income and Minority Businesses	Medium	
		Potential for Community Facilities Impacts in Low-Income or Minority Areas	Medium	
Goal 3: Regional Transit System Performance			◔	
1	Increase capacity and ridership.	Opening Year Preliminary Daily Ridership	High	Travel forecast results compared to other alternatives (July 2009)
		Forecast Year Preliminary Daily Ridership	High	
		Opening Year Annual Riders (System-wide)	High	
		Forecast Year Annual Riders (System-wide)	High	
		Daily Station/Stop Boardings	High	
2	Enhance efficiency and cost effectiveness.	Capital Costs per Passenger Mile (163 M)	Medium-High	Capital cost / one-way route miles (July 2009 capital cost estimate)
		Cost Effectiveness Index (potential for a medium rating)	Medium-High	FTA CEI Rating (July 2009 capital cost and ridership results)
3	Facilitate connections and linkages.	Number of Transfers between Select Origin-Destination Pairs	High	Travel forecast results
4	Reduce transit travel times.	Transit Travel Times between Representative Origin-Destination Pairs	High	130th Street terminal station to Loop
5	Integrate existing transit infrastructure, where feasible.	System Criteria Compatibility	High	Compatible with existing Red Line rail or 95th Street terminal station
		Interoperability with Existing Service	High	
		Consistency with Existing Infrastructure	High	
Goal 4: Safety and Security			○	
1	Increase transportation reliability.	Operating Reliability	High	Transit mode and service plan supports travel forecast
2	Improve incident response capabilities.	Potential Impact on Emergency Vehicle Incident Response Capability	High	Number of potential impacts to disrupt emergency vehicles (example rail grade crossings)
3	Incorporate design elements that enhance safety and security.	Extent of Vehicle/Transit/Pedestrian Conflicts that are not Fully Protected	High	Number of pedestrian/transit and vehicle/transit potential conflicts
Goal 5: Environmental Quality			◔	
1	Limit impacts.	Potential for Negative Visual Impact	Medium-High	Proximity to community facilities, residences and businesses with frontage to alignment
		Potential for Archaeological Site Impacts Within the Proposed Right-of-Way	High	Number of archaeological site impacts within the proposed right-of-way
		Buildings Listed or Eligible for Listing in the NRHP Within 200 Feet	High	Number of historic structures within 200 feet of the proposed right-of-way
		Districts Listed or Eligible for Listing in the NRHP Within 200 Feet	High	Number of existing historic or eligible districts within 200 feet of the proposed right-of-way
		Parklands and Recreation Areas Impacted	Medium	Number of parkland and recreation areas impacted
		Anticipated Noise and Vibration Impact Potential for Mode (contour based on FTA guidance)	Medium-High	Noise and vibration analysis
		Wetland Impacts (5 within corridor)	Medium-High	Number of delineated or potential wetlands impacted
		Critical Habitat Impacts (0 impacted)	High	Number of critical habitats impacted
2	Support environmental benefits.	Consistency with Regional Air Quality Plans	High	CMAP conformity analysis
3	Reduce reliance on automobile travel.	Travel Forecast Modal Split	High	Based on travel forecast with the best improvement in transit trips and reduction in vehicle trips

Performance Rating Scale: ● ◕ ◒ ◔ ○

Poor (Low) -------- Medium -------- Good (High)

7.0 PUBLIC INVOLVEMENT

7.1 Public Involvement Approach

As part of the FTA's Alternative Analysis process the CTA conducted an array of public involvement activities. In order to achieve a high level of participation, a comprehensive public involvement plan was developed and implemented.

7.1.1 Description of Outreach Program

Over the course of the AA study, a series of three public presentations were conducted within the Red Line Extension Alternatives Analysis Study area to encourage the general public's participation at key project stages. Through presentations and displays, the public learned about the methodology of the New Starts federal planning processes and how evaluation criteria were developed and applied to the universe of alternatives for the Red Line AA. A formal question and answer process allowed the general public to make comments and ask questions on the study's findings.

Individual and group briefings for elected and public officials; community, civic, business and religious leaders; and other stakeholders were conducted along the same timeline, providing them the opportunity to comment and inquire about the project.

The public had continual access to the project's public outreach presentation materials on the Red Line Extension AA Study weblink via the CTA's website (www.transitchicago.com). In addition to presentation materials, the website provides information on how to submit comments and questions to CTA via phone, email and standard mail. At the end of each public comment period, all questions and answers were posted on the project website. In addition, a database of participants in the outreach process was developed and continually updated, and CTA's community outreach database was also used. CTA's existing database includes community groups, non-profits, community development organizations, and chambers of commerce.

Throughout the public involvement process, the CTA monitored participation from the general public, elected officials, and stakeholders to gauge public interest and opinion regarding the proposed project. To identify potential modification to the public notification process, CTA analyzed the number of attendees and the geographic representation through regularly scheduled discussions with local elected officials and through monitoring attendance at the public meetings.

7.1.2 General Public

Each affected community within the study area has had different levels of interest in the project, due to many factors including intended use; direct or indirect impacts; support for or lack of support for transit improvements; and potential or perceived degree of project impact on property and/or daily routines. This acknowledgement was integral to CTA's evaluation of whether the public education and involvement process was targeted properly or if it required adjustment to better reach and inform the public.

The study area encompasses several neighborhoods: Beverly, Altgeld Gardens, Pullman, Morgan Park, Roseland, Longwood Manor, Princeton Park, Cottage Grove Heights, Burnside, and Washington Heights. Outreach was conducted to the study area as a whole and CTA was also aware of the distinct neighborhoods and was able to identify critical local issues.

Three rounds of presentations took place over the course of the study: one for each level of alternatives screening. Because of the length of the Red Line Extension's alternative corridors, each round consisted of two meetings, for a total of six public meetings. Two identical meetings per screening phase ensured adequate stakeholder and community coverage throughout the study area. Prior to each presentation, the public was informed of the meetings through advertisements in local newspapers and car cards posted on CTA buses, trains, and in stations. During the second and third phases, previous participants were also notified by letter or email. Local stakeholders and elected officials were also recruited to help conduct outreach to generate more project and public interest in attending these meetings.

The first round of meetings outlined the Purpose and Need of the Red Line Extension Alternatives Analysis Study and presented the preliminary findings from Screen 1. The second round of public meetings reviewed the findings of Screen 1, presented the preliminary findings of Screen 2, and solicited comments and questions. The third round of meetings reviewed the findings of Screen 2, presented the preliminary findings of Screen 3, announced a recommended Locally Preferred Alternative (LPA), and solicited comments and questions particularly relating to the recommended LPA.

7.1.3 Stakeholders and Local Officials

Individual and group briefings were held to allow stakeholders and elected officials to share perspectives, interests, and potential concerns, as well as to offer their recommendations for strengthening candidate alternatives or to identify additional alternatives. Following the same schedule as the general public program, three rounds of briefings are scheduled for the Red Line Extension Alternatives Analysis Study. Stakeholders and elected officials also were invited to attend the public meetings. Stakeholder and elected official categories include the following:

Civic Organizations
Civic organizations include transportation, environmental, regional-growth or business-related groups.

Activity Generators
Members of this category include retail locations, area attractions, and parks.

Religious Organizations & Neighborhood Groups
Members of this category include ministers, local chambers of commerce, block clubs, and other community groups.

Government Facilities, Infrastructure, and Institutions
This category includes schools, operational facilities, neighborhood parks, railroads, and universities.

U.S. Representatives and U.S. Senators
Individual briefings for the Congressmen and Senators and/or their staff were conducted for the initial round of briefings. They were also invited to attend all public meetings. As the screening process proceeded and the study entered the final stages, another round of briefings were held with the Congressmen and Senators to provide the opportunity for them to comment on the recommended LPA.

Aldermen
Establishing a dialogue with aldermen inside the study area was critical for the public involvement efforts. Local aldermen served as a resource to assist CTA in expanding the list of local stakeholders, engage their residents in the process, and identify local issues pertinent to

the AA process. Aldermen were briefed regularly and were invited to participate in the public meetings and local stakeholder meetings

State and County Officials
These officials were informed of the AA study's progress. They also served as another resource to CTA to identify additional stakeholders, and to inform and explain potential local issues to CTA.

Surrounding Municipalities
A portion of the Village of Calumet Park is located within the study area, and Blue Island and Riverdale border the study area. CTA contacted these three municipalities and the South Suburban Mayors & Managers Association to identify potential stakeholders and other interest groups to be included in this public involvement process. CTA also sent alerts to other surrounding municipalities to keep them informed of the process.

7.2 Implementation and Execution of Public Involvement

The CTA Red Line Extension Alternatives Analysis Study Public Involvement included various meetings held in conjunction with each alternatives screening. Each round of meetings focused on the respective Screening phase. Each of the three rounds were conducted in a similar manner to ensure consistency.

Public Meeting Locations
The first step entailed identifying appropriate locations within the study area to hold the public presentations. Locations were identified in conjunction with the Aldermen in the study area. Locations identified changed during each round of meetings to ensure thorough study area coverage:

The locations identified met the following criteria:

- Location must be available on date of presentation;
- The facility must be able to accommodate a theater-type presentation that can hold at least 100 people and the presentation boards, technical staff, and public;
- Must be ADA accessible;
- Near public transportation; and
- Free of charge.

Meeting facilities were booked for public meetings several weeks in advance of the actual meetings to enable informative and accurate public notification. All logistical arrangements were arranged and confirmed.

Elected Official Briefings
All elected officials were informed them of scheduled public meetings. Those officials interested in a scheduled meeting were:

- Briefed using a flip board presentation
- Encouraged to identify stakeholders to be contacted in their area
- Encouraged to identify potential public meeting locations

Officials were contacted for follow-up meetings to update them regarding issues to be discussed at public meetings and to provide opportunity to comment prior to the meeting.

Public Meeting Announcements

CTA used the following methods to ensure that the stakeholders and general public were aware of the meetings:

- Meeting announcements appeared in local community papers two weeks in advance of the scheduled meetings.
- Some community papers were weeklies and required meeting notices to run twice
- Stakeholders were given information regarding upcoming meetings as a supplement to these advertisements
- Meeting announcements were posted on CTA’s website
- Meeting announcement were posted at CTA stations and in CTA trains and buses via car cards
- CTA distributed and posted a press release including meeting details

Any member of the public interested in attending one or the entire series of presentations was welcome. No pre-registration was required.

7.3 Meeting Format

Each meeting included the following formats: an arcade open house, in which an area was dedicated to project maps and alternatives analysis process displays, a formal presentation including a PowerPoint presentation on Screen 1, 2, or 3 and a question and answer session.

The entire session was allotted two hours, beginning at 6:00 P.M. and ending at 8:00 P.M. This schedule allowed sufficient time to conduct the presentation, answer questions, and allow attendees to view the information on the presentation boards. The time was expanded when public involvement warranted.

Prior to each meeting, an internal client/consultant meeting and rehearsal was held to evaluate the effectiveness of the meeting and identify potential improvements for future meetings.

Arcade Open House

When attendees first arrived at the facility at 6:00 P.M., they signed in and were asked to provide contact information. They will were given a question/comment card and directed to the arcade. In the arcade, attendees had an opportunity to review project information and to familiarize themselves with the project so they can prepare questions or comments before the formal presentation and question and answer session.

The arcade was staffed by CTA and the project consultant team and included a series of poster boards (35 inches across and 47 inches tall) displaying maps, analysis results and recommendations.

Formal Presentation

The presentation consisted of a PowerPoint presentation lasting approximately 25 minutes. An interpreter for the hearing impaired and a translator for Spanish speaking individuals were available.

Question & Answer Session

At the conclusion of the presentation, the moderator explained the procedure for the question & answer session. There was a short break for participants to formulate their comments and/or questions. All questions were submitted in writing using question/comment cards provided to attendees at the sign-in table. The comment cards were collected by CTA and grouped in like categories. The moderator read the questions/comments to the audience and the presentation panel provided answers verbally.

All questions received regarding the Red Line Extension Alternatives Analysis Study were also answered in writing and posted on the CTA website.

7.4 Screen 1 Public Involvement Summary

The CTA hosted two community meetings in the study area on April 10 & 11, 2007. These meetings presented the findings of Screen1 of the AA study.

The CTA placed advertisements to inform the community of the proposed project and upcoming meetings through local community newspapers, Chicago public libraries, local universities and colleges, aldermanic offices, customer alerts on CTA buses and stations (English & Spanish) and postings at village halls adjacent to the study area. The community newspapers included The Crusader (3/31 & 4/7), The Defender (4/4 & 4/6-10), La Raza (April 8-14), The Star Newspaper/The Daily Southtown (4/5). Additionally, the Chicagoland Chamber of Commerce, Alderman Beale and the Calumet Area Industrial Council posted information on their websites. Village hall postings included Burnham, Blue Island, Calumet, Calumet Park, Dolton, Evergreen Park, and Riverdale.

Prior to the public meetings, CTA met with community leaders, chamber of commerce executive directors, and aldermen and/or their staff. Additionally, CTA staff asked these leaders to assist them by submitting names of local groups/organizations that are active in the community and would be interested in this extension study, as well as becoming proactive participants of the public involvement process of the AA study. Recommended groups were added to the community outreach database. CTA contacted by letter 34 elected officials. Sixteen meetings were held to brief interested elected officials. There were 74 stakeholders invited to participate in a briefing on the morning of April 10, 2007. This briefing was held at Carver Military Academy. Fourteen individuals attended representing 11 organizations.

The public meetings were held at Chicago State University (April 10) and Chicago Public Library –West Pullman Branch (April 11) from 6:00-8:00 P.M. Sixty-six people attended the April 10 meeting. Eighty-one people attended the April 11 meeting. The presentation and meeting materials were made available on the website on the morning after the first public meeting.

The most common comment received was in regard to preferences for the alignments (corridors) studied – 89 comments in total. There was a strong level of support voiced for the UPRR corridor (55). The next category that received a high number of comments was in regard to economic and environmental impacts. Many people were interested in the economic benefits the study area would gain, including new access to jobs or jobs created by the project itself. Another common comment was on the project timeline with people wanting the project to move forward more rapidly.

The official comment period remained open until May 11, 2007. Two hundred and nine comments or questions were collected. These were answered by CTA staff and posted to the project website. Once posted, elected officials, stakeholders and meeting participants received either an email or letter notifying them that the comments and responses were now available on-line.

7.5 Screen 2 Public Involvement Summary

The CTA hosted two community meetings in the study area on December 3 and 4, 2008. These meetings presented the findings of Screen 2 of the AA study.

The CTA placed advertisements to inform the community of the proposed project and upcoming meetings through local community newspapers, Chicago public libraries, local universities and colleges, aldermanic offices, customer alerts on CTA buses and stations (English & Spanish) and postings at village halls adjacent to the study area. The community newspapers included The Crusader (11/20), The Defender (11/12 and 11/19), La Raza (11/23), The Southtown Star (11/20). Additionally, the Chicago 6th Ward office of Alderman Beale, Chicago Metropolitan Agency for Planning, Regional Transportation Authority, and the Active Transportation Alliance, posted information on their websites. Village hall postings included Burnham, Blue Island, Calumet, Calumet Park, Dolton, Evergreen Park, and Riverdale.

Similar to Screen 1 of the project, CTA met with community leaders, and elected officials and/or their staff prior to the public meetings. CTA staff briefed these leaders on the Screen 2 findings and also asked them to identify local groups/organizations that are active in the community and would be interested in this extension study. Recommended groups were added to the community outreach database. CTA contacted by letter 34 elected officials. Eight meetings were held to brief interested elected officials. There were 79 stakeholders invited to participate in a briefing on the morning of December 3, 2008. This briefing was held at Woodson Regional Chicago Public Library. Ten individuals attended representing 9 organizations.

The public meetings were held at Historic Pullman Visitor Center (December 3, 2008) and Woodson Regional Chicago Public Library (December 4, 2008) from 6:00-8:00 P.M. Using the data base from the prior public meetings, the CTA invited participants whom attended the Screen 1 public meetings. One hundred seventy people were invited to participate by letter or email. Forty-three people attended the December 3, 2008, meeting. Forty-one people attended the December 4, 2008 meeting. The presentation and meeting materials were made available on the website on the morning after the first public meeting.

The most common comment received expressed preferences for the alignments (corridors) studied - 50 comments in total. As in Screen 1 participants expressed a strong support for the Union Pacific Railroad (UPRR) corridor (31). The next category that received a high number of comments was in regard to the public involvement process. Participants were interested in how the screening criteria applied throughout the analysis to advance the alternatives being evaluated, if individual suggestions were considered and what information was available to the public. Another common comment was on the project timeline with people inquiring how much longer the process would take and when it would be completed.

The official comment period remained open until December 18, 2008. One hundred thirty-one comments or questions were collected. These were answered by CTA staff and posted to the project website. Once posted, elected officials, stakeholders and meeting participants received either an email or letter notifying them that the comments and responses were available online.

7.6 Screen 3 Public Involvement Summary

The CTA hosted two community meetings in the study area on June 3 and 4, 2009. These meetings presented the findings of Screen 3 and the recommendation of a LPA.

The CTA placed advertisements to inform the community of the proposed project and upcoming meetings through local community newspapers, customer alerts on CTA buses and stations (English & Spanish) and postings at village halls adjacent to the study area. The community newspapers included The Crusader (May 14 & 21), The Chicago Defender (May 13 & 30), La Raza (May 17), and The Southtown Star (May 18). Additionally, the Regional Transportation Authority, the Chicago Metropolitan Agency for Planning, Progressive Railroading, the Active Transportation Alliance, Transit Future, and the Chicago Defender, posted information on their websites or in their e-newsletters. The Chicago Citizen newspaper also published an article regarding the meeting. Village hall postings included Burnham, Blue Island, Calumet, Calumet Park, Dolton, Evergreen Park, and Riverdale.

Similar to the earlier phases of the project, CTA met with community leaders and elected officials and/or their staff prior to the public meetings. CTA staff briefed these leaders on the Screen 3 findings and presented the recommended LPA. Additionally, CTA staff asked these leaders to identify local groups/organizations that are active in the community and would be interested in this extension study. Recommended groups were added to the community outreach database. CTA contacted by letter 34 elected officials. Eleven meetings were held to brief interested elected officials and/or their staff. Represented in the meetings were Aldermen from 6 Chicago wards, a Cook County Commissioner, a U.S. Congressman, 2 State Representatives, and a State Senator. There were 86 stakeholders invited to participate in a briefing on the morning of June 3, 2009. This briefing was held at Olive Harvey College. Fourteen individuals attended representing 13 organizations.

The public meetings were held at Olive Harvey College (June 3, 2009) and Woodson Regional Chicago Public Library (June 4, 2009) from 6:00-8:00 P.M. Using the data base from the prior public meetings, the CTA invited individuals who participated in the Screen 1 and 2 public meetings. Two hundred eighteen people were invited to participate by letter or email. Forty-four people attended the June 3, 2009 meeting. Sixty-seven attended the June 4, 2009 meeting. The presentation and meeting materials were made available on the website on the morning after the first public meeting.

A total of 111 comments were received at the stakeholder and public meetings, via e-mail, or U.S. Postal Service. The majority of the comments received were related to economic and environmental impacts. Some focused on the opportunity for business and job development whiles others questioned the impact on homes and property. In addition, many comments were in support or opposition to the project, and some questioned how their support would affect the outcome of the project. Lastly, a petition that included 512 signatures was submitted in support of the CTA’s recommended LPA.

The official comment period was extended to June 25, 2009. Questions and comments were responded to by CTA staff and posted to the website (transitchicago.com).

On August 12, 2009 the Chicago Transit Board met and the adopted an LPA. A letter was sent to participants, stakeholders and agency outreach inviting them to submit comments or participate in the Board action. At the meeting comments were made by stakeholders in support of the Red Line Extension. The CTA will now move to the Environmental Impact Statement step of the FTA process. There will be additional opportunities for public involvement in subsequent steps of the FTA process.

7.7 Final Reporting

Upon the completion of all the public involvement activities CTA completed Public Involvement binders for each corresponding screen. These included all related information for public meeting announcements, elected official meetings, stakeholder meetings, public meetings, public involvement, media coverage, examples of the CTA website, any follow up activity, as well as copies of all registration cards and any comment that was submitted during each screen.

8.0 NEXT STEPS

The preparation of a Draft Environmental Impact Statement (DEIS) will be the next step following the recent selection of a LPA. After completion of scoping for the EIS, the CTA will prepare an application to the Federal Transit Administration (FTA) for advancement into Preliminary Engineering phase of the New Starts process. Issues that will be addressed in these next steps include:

- Detailed alignment analysis for the LPA
- Details of intermediate and terminal station locations
- Right-of-way requirements
- Impacts identification and proposed mitigation measures
- Costs and possible phasing
- Evaluation of the cost effectiveness of project elements

There will be opportunities for public involvement in subsequent project phases.

Section 1
Introduction

1.1 Overview

The Chicago Transit Authority (CTA) is proposing to make transportation improvements by extending the Red Line from the 95th Street station to 130th Street. CTA and the Federal Transit Administration (FTA) will be preparing an Environmental Impact Statement (EIS) that will evaluate the environmental effects of constructing and operating the proposed extension. FTA is the federal lead agency and CTA is the local lead agency.

The Red Line was put into operation in 1969. Plans to extend the Red Line to the southern city limits were made shortly thereafter but have not yet been implemented. Starting in 2002, community activists began an awareness campaign and a community petition drive which resulted in an advisory referendum being placed on the November 2004 ballot. The referendum was supported by 38,000 voters in the 9th and 34th wards. In 2006, the Chicago Transit Board initiated an Alternatives Analysis (AA) study for the proposed extension.

The study area is situated 11 miles south of the Chicago Central Area (commonly referred to as the Loop) and encompasses approximately 20 square miles. The boundaries of the study area are 95th Street on the north, Ashland Avenue on the west, Stony Island Avenue on the east, and the Calumet-Sag Channel/Little Calumet River and 134th Street on the south.
The I-57 Expressway and I-94 Bishop Ford Freeway traverse the western and eastern edges of the study area, respectively. Lake Calumet is located in the eastern portion of the study area.

The study area encompasses parts of nine community areas in the City of Chicago and the eastern section of the City of Calumet Park (area east of Ashland Avenue). Community areas include Washington Heights, Beverly, Morgan Park, Roseland, Pullman, West Pullman, South Deering, Hegewisch and Riverdale. The study area has significant residential (primarily single family) industrial (existing and vacant), transportation and commercial development. The study area boundaries are major, recognizable streets, used to clearly define where possible alternatives would be considered. However, travel patterns and analyses beyond the study area are integral components to the project study and included as necessary.

For the Red Line Extension project the CTA has completed an Alternatives Analysis (AA) and conducted early scoping on the potential range of alternatives. The results of that study may be found in the Locally Preferred Alternative Report (CTA 2009) and which is incorporated here by reference. The AA provides the reasoning for decisions regarding the identification and narrowing of the range of alternatives. The AA process identified an initial set of nine corridors and eleven transit modal technologies. The process screened these options into a set of eight conceptual alternatives that potentially met the project purpose. These alternatives were screened against criteria related to constructability, right-of-way constraints, impacts of configurations, and operational concerns. This screening step narrowed the range of alternatives to three build alternatives and a no build alternative and a transportation system management (TSM) alternative. These alternatives were screened against the goals, objectives, and evaluation criteria established for the project.

In addition, input from stakeholders, the public and agencies was solicited in the process of narrowing the range of alternatives. The AA process resulted in the identification of a locally preferred alternative (LPA) in addition to one other build alternative (the Halsted HRT Alternative), the No Build Alternative, and a TSM Alternative that will be carried forward into the DEIS. A Locally Preferred Alternative (LPA) was identified through the AA process and designated by the Chicago Transit Board in August 2009.

The EIS will evaluate the LPA along with a No Build Alternative, a Transportation System Management (TSM) Alternative, and the Halsted Alternative developed during the AA process. Subsequent to the completion of the AA process, FTA and CTA initiated the public and agency NEPA scoping to obtain input on the scope of the EIS. The Notice of Intent (NOI) identified the four alternatives carried forward from the AA for evaluation. This report summarizes the results of the NEPA scoping process.

The Draft EIS (DEIS) will build upon the AA studies and form the basis for performance of Preliminary Engineering and preparation of a subsequent Final EIS. One of the primary purposes of scoping is to identify possible environmental impacts of the project. Transit improvements in the Far South side could be financed with a mix of local, state, federal New Starts, and other federal funds. Accordingly, the project will be executed in compliance with current FTA Section 5309 New Starts guidelines, and all environmental documents will satisfy the requirements of NEPA and the Safe, Accountable, Flexible, Efficient Transportation Equity Act: A Legacy for Users (SAFETEA-LU).

1.2 Project Area

The proposed project area is located 11 miles south of the Chicago Central Area (commonly referred to as the “Loop”). The limits of the project area are from 95th Street on the north to 130th Street on the south. The Calumet-Sag Channel/Little Calumet River extends along the southern edge of the project area and Lake Calumet is located to the east. The I-57 Expressway and I-94 Bishop Ford Freeway traverse the western and eastern edges of the project area, respectively.

The project area includes parts of eight community areas in the far south side of the City of Chicago. Community areas include Washington Heights, Morgan Park, Roseland, Pullman, West Pullman, South Deering, Hegewisch, and Riverdale. The project area encompasses significant residential (primarily single family), industrial (existing and vacant), transportation, and commercial developments.

1.3 Alternatives

The Red Line Extension EIS will include an evaluation of a No Build Alternative, a Transportation System Management Alternative, the Locally Preferred Union Pacific Railroad Heavy Rail Transit (HRT) Alternative, and the Halsted Street HRT Alternative. These alternatives are briefly described below.

1.3.1 No Build Alternative

The No Build Alternative is defined as the existing transportation system, plus any committed transportation improvements. Committed transportation improvements include projects that are already in the Chicago Metropolitan Agency for Planning (CMAP) financially constrained

Transportation Improvement Program (TIP). The Red Line project area has five bridge reconstructions, and several road improvement projects included in the FY 2007 – 2012 TIP. These improvements are primarily on highway segments in the vicinity of the project area and generally do not lie adjacent to or intersect with the proposed TSM or HRT alternatives.

Bridge projects in the TIP include: Illinois 1 (Halsted Street) at the Little Calumet River; I-94 (Bishop Ford Expressway) at the Stony Island Avenue ramp and at Cottage Grove Road; I-57 at 103rd Street; and I-57 at Genoa Road. Road improvement projects include a variety of landscaping, safety fencing, and resurfacing projects, and coordination of signal timing on Stony Island Avenue from 95th Street north, and on 95th Street from Western Avenue east to Ewing Avenue. There is also a bicycle and pedestrian multi-use trail proposed to extend from the existing Centennial Trail in Lemont to the Burnham Greenway in Burnham.

Bus transit service under the No Build Alternative would be focused on the preservation of existing services and projects. No significant changes to bus service are anticipated in the project area. All elements of the No Build Alternative are included in each of the other alternatives.

Summary:

- Existing transportation system.
- Plus committed transportation improvements: bridge and road improvement projects.
- Bus transit service focused on the preservation of existing services and projects.

1.3.2 Transportation System Management (TSM) Alternative

The proposed TSM Alternative is a Bus Rapid Transit (BRT) alternative that operates between the 95th Street Station and 130th Street via East 95th Street, Michigan Avenue, East 127th Street, South Indiana Avenue, and East 130th Street. Proposed BRT service would operate in mixed traffic with traffic signal priority along 95th Street, Michigan Avenue, and 130th Street.
The TSM Alternative is 5.5 miles long and would include four intermediate stops at 103rd, 111th, 115th, and 130th Streets with park-and-ride facilities proposed at all of the new stops. The 95th Street terminal would be expanded to extend the existing bus bays along State and Lafayette Streets approximately 250-feet north to 94th Street to improve circulation and safety. The TSM alternative assumes that buses from the south would continue to serve the 95th Street Station.

Summary:

- Transportation improvements that are already in the CMAP Fiscal Year 2007-2012 TIP as described in the No Build Alternative.
- Bus Rapid Transit (BRT) that operates between the 95th Street Station and 130th Street.
- 5.5 miles long with three intermediate stops at 103rd, 111th, and 115th Streets and a new terminal station at 130th Street.
- Park-and-ride facilities proposed at all new stops.
- Operates in mixed traffic with traffic signal priority along 95th Street, Michigan Avenue, and 130th Street.
- 95th Street terminal expanded to extend the existing bus bays along State and Lafayette Streets approximately 250-feet north to 94th Street to improve circulation and safety.
- Existing buses from the south continue to serve the 95th Street station.

1.3.3 Locally Preferred Alternative (LPA): Union Pacific Railroad (UPRR) Heavy Rail Transit (HRT) Alternative

The proposed LPA would extend the heavy rail transit line from the existing Red Line 95th Street Station to 130th Street. The line would be on an elevated structure from the 95th Street as it heads south along the I-57 Expressway for nearly one-half mile until reaching the UPRR corridor in the vicinity of Eggleston Avenue. It would then turn south along the UPRR corridor to approximately 111th Street where it would turn southeast. East of South Prairie Avenue, the alignment would cross over the Canadian National/Metra tracks near 119th Street where it would transition to an at-grade profile and then continue southeast along the former Michigan Central/Indiana Harbor Belt (IHB) railroad right-of-way to terminate in the vicinity of 130th Street.

The proposed LPA is 5.3 miles long and would include three new intermediate stations at 103rd, 111th, and 115th Streets and a new terminal station at 130th Street with new park-and-ride and bus terminal facilities at each station. This alternative assumes that buses from the south would be re-routed to serve the new intermediate and terminal stations to speed passenger travel toward downtown Chicago.

The new HRT tracks would be placed immediately adjacent to the UPRR right-of-way on either the west side (West Side Option) or the east side (East Side Option). Both options would require adjacent property acquisition to accommodate the CTA right-of-way and station facilities at 103rd, 111th, and 115th Streets. The West Side Option could impact Fernwood Parkway between 99th Street and 103rd Streets which could trigger a Section 4(f) of the Department of Transportation Act evaluation in the EIS. The East Side Option could impact Wendell Smith Park adjacent to the I-57 Expressway which could also trigger a Section 4(f) evaluation in the EIS.

There are two options for the 130th Street terminal station. The Red Line extension would continue south along the IHB right-of-way to either a south or west terminal station location along the north side of 130th Street, just west of the I-94 Bishop Ford Freeway.

Summary:

- Transportation improvements that are already in the CMAP Fiscal Year 2007-2012 TIP as described in the No Build Alternative.
- Heavy rail transit line extension from 95th Street Station to 130th Street.
- 5.3 mile extension with three new intermediate stops at 103rd, 111th and 115th Streets and a new terminal station at 130th Street.
- New park-and-ride and bus terminal facilities at each station.
- Buses from the south would be rerouted to serve the new intermediate and terminal stations to speed passenger travel to downtown Chicago.
- Two alignment options will be studied in the EIS: Tracks could be placed immediately adjacent to the UPRR right of-way on either the west side (West Side Option) or the east side (East Side Option).
- Two options for the 130th Street terminal station will be studied in the EIS: The line would continue south along the IHB right-of-way to either a south or west terminal station location along the north side of 130th Street, just west of the I-94 Bishop Ford

Freeway.

1.3.4 Halsted Street Heavy Rail Transit Alternative

The proposed Halsted Street HRT Alternative would be operated on an elevated structure between the existing Red Line 95th Street Station and the Halsted Street/Vermont Avenue intersection in the vicinity of 127th Street. The alignment would follow the median of I-57 Expressway until reaching Halsted Street. It would then turn south onto Halsted Street and continue in the median to Vermont Avenue.

The proposed Halsted Street HRT Alternative is 5.0 miles long and would include three new intermediate stations at 103rd, 111th, 119th Streets and a new terminal station at Vermont Avenue with new park-and-ride and bus terminal facilities at the intermediate and terminal stations. This alternative assumes that buses from the south would be re-routed to serve the new intermediate and terminal stations to speed passenger travel to downtown Chicago.

Near the proposed station areas, there may be additional impacts to adjacent land owners if land acquisition would be required for station facilities such as bus turnarounds or parking facilities. This would be most applicable at the proposed terminal station at 127th/Vermont since several properties are located close to Halsted Street in this segment and there may be higher off-street facility needs.

Summary:

- Transportation improvements that are already in the CMAP Fiscal Year 2007-2012 TIP as described in the No Build Alternative.
- Heavy rail transit line extension from 95th Street Station to Halsted Street/Vermont Avenue intersection.
- 5.0 mile extension with three new intermediate stops at 103rd, 111th, 119th Streets and a new terminal station at Vermont Avenue.
- New park-and-ride facilities at intermediate and terminal stations.
- Buses from the south would be rerouted to serve the new intermediate and terminal stations.

1.4 Summary of Purpose and Need

The purpose of the Red Line Extension project is to reduce travel times to jobs for Far South Side and South Suburban residents and improve the performance of the existing Red Line 95th Street Station terminal. The project would also provide an opportunity to support economic development initiatives. The City of Chicago has designated several Tax Increment Finance (TIF) districts, Redevelopment Areas(RA), and Industrial Corridors in the study area. Major incentive zone areas in the study area include the 119th/Halsted RA, the Roseland/Michigan Avenue RA, the Pullman Industrial Corridor, and several smaller TIF districts.

The need for the project is based on the following considerations:

- Lack of park-and-ride and passenger drop off, and poor pedestrian facilities limit access to the existing 95th Street terminal of the Red Line.
- Customers accessing the existing terminal facility by bus experience measureable delays resulting from poor performance of surrounding arterial intersections, insufficient space

for bus loading and unloading, and insufficient space for bus layovers.

- Congested bus and passenger conditions at the existing terminal station and bus facility result in safety issues and diminish the attractiveness of transit as an alternative to other travel modes.
- Roadway performance in the study area is adversely impacted by narrow arterial streets and frequent at-grade freight rail crossings.
- Study area population is highly transit dependent, minority, and low-income. Presently, this population is underserved by rail transit compared to other areas in the region.

1.5 Project Participants

The project participants include FTA, CTA, and CTA's consultants. CTA's consultants include the CWC Transit Group and CWC's subconsultants. The Federal Highway Administration (FHWA) has been identified as a cooperating agency. Other project participants include federal, state, and local participating agencies identified in accordance with the Safe, Accountable, Flexible, Efficient Transportation Equity Act – A Legacy for Users (SAFETEA-LU) 6002. Participating agencies have been identified and are listed in Appendix C.

1.6 Purpose of Report

The following report summarizes the public participation process for, and the public comments resulting from, the Red Line Extension public scoping meetings and comment period. The process of determining the scope, focus, and content of an EIS is known as "scoping." Scoping meetings are a useful opportunity to obtain information from the public and governmental agencies. In particular, the scoping process asks agencies and interested parties to provide input on the proposed alternatives, the purpose and need for the project, the proposed topics of evaluation, and potential impacts and mitigation measures to be considered.

Section 2
Scoping Process

2.1 Early Scoping Activities

In 2006, CTA and FTA began the Alternatives Analysis (AA) process, for the proposed Red Line Extension. As part of a three step screening process, CTA held six public meetings between 2007 and 2009 in order to help define the purpose and need and identify a range of reasonable alternatives. This AA process is an early public scoping process and was conducted consistent with the Federal Transit Administration's (FTA) guidelines.

Early scoping included a series of three screening evaluations and public outreach efforts. The first step, Screen 1, included meetings with elected officials and community groups in the study area, a meeting with stakeholders, a Technical Advisory Committee (TAC) meeting, and two public meetings. The two public meetings were held on April 10 and 11, 2007. A total of 147 persons attended the two public meetings and 14 representatives of 11 community and governmental organizations attended the stakeholder session, held prior to the public meetings.

The second step, Screen 2, again included meetings with elected officials and community groups in the study area, a meeting with stakeholders, a Technical Advisory Committee (TAC) meeting, and two public meetings. The two public meetings were held on December 3 and 4, 2008. A total of 84 persons attended the two public meetings, and 10 representatives of 10 organizations attended the stakeholder session, held prior to the public meetings.

The third step of the process, Screen 3, included two public meetings held on June 3 and 4, 2009. Prior to the public meetings, CTA conducted 11 briefings of elected officials and their staff and one stakeholder meeting. Fourteen representatives of 13 organizations attended the stakeholder briefing.

Screen 1
- April 10, 2007 - public meeting
- April 11, 2007 - public meetings

Screen 2
- December 3, 2008 - public meetings
- December 4, 2008 - public meetings

Screen 3
- June 3, 2009 - public meetings
- June 4, 2009 - public meetings

During early scoping, CTA evaluated nine alternatives, and in August 2009, the Chicago Transit Board designated the Union Pacific Railroad (UPRR) Heavy Rail Transit (HRT) Alternative as the Locally Preferred Alternative (LPA) for further study in the EIS. The LPA was chosen, in part, due to agency participation and public participation through review and comments.

2.2 Draft Environmental Impact Statement (DEIS) Scoping Activities

In accordance with NEPA, CTA and FTA have initiated the environmental review process for the Red Line Extension. An EIS will be prepared to identify impacts related to project construction and operation. As part of the initial phase of the environmental process, public scoping meetings were hosted on September 22, 2009 and September 24, 2009, to receive public comments on the alternatives and issues that should be examined as part of the environmental analysis. The public meetings are also a requirement of the Safe, Accountable, Flexible, Efficient Transportation Equity Act: A Legacy for Users (SAFETEA-LU), which requires project proponents to provide opportunities for public participation in transportation decision-making. The process of determining the scope, focus, and content of an EIS is known as "scoping." Scoping meetings are a useful opportunity to obtain information from the public and governmental agencies. In particular, the scoping process asks agencies and interested parties to provide input on the proposed alternatives, the purpose and need for the project, the proposed topics of evaluation, and potential impacts and mitigation measures to be considered.

2.2.1 Public Participation Plan

NEPA and SAFETEA-LU require project proponents to provide opportunities for public participation in transportation decision-making. In order to meet the requirements of these two Acts, a Public Participation Plan (Appendix A) was developed to guide CTA through a comprehensive public participation process for the Red Line Extension EIS scoping phase. The plan includes public participation goals, strategies to engage the public, key audiences to be addressed and the plan for notification and outreach for the scoping phase of the project. The Public Participation Plan that is included in Appendix A was developed specifically for the scoping process and will be updated to address outreach needs for the release of the Draft Environmental Impact Statement.

2.2.2 Coordination Plan

Section 6002 of the Safe, Accountable, Flexible, Efficient Transportation Equity Act: A Legacy for Users (SAFETEA-LU) established an environmental review process for transit projects that has now been included in Section 139 of Title 23 of the U.S. Code. Section 139 directs agencies to prepare a plan for coordinating public and agency participation in and comments on the environmental review process for a project. The coordination plan describes how the lead agencies will provide opportunities for input from both the public and other agencies. The Coordination Plan includes the Public Participation Plan described above in Section 2.2.1.

2.3 Initiation of Scoping - Notice of Intent (NOI)

FTA published the NOI in the Federal Register on September 1, 2009. The publication of the NOI is the official federal notification of the agency's intent to prepare a DEIS. The NOI included notification of the dates and locations of the agency and public scoping meetings, the public comment period, as well as a description of the project purpose and need and alternatives. The NOI initiates the NEPA scoping process. A copy of the NOI is in Appendix B. Comments were accepted by CTA from the date of publication of the NOI in the Federal Register (September 1, 2009) through October 27, 2009. This provided a public comment period of 57 days.

2.4 Agency Scoping

2.4.1 Participating Agencies

Participating agencies can be Federal, State, tribal, regional, and local government agencies that may have an interest in the project. In accordance with SAFETEA-LU Section 6002 requirements, CTA, in coordination with the FTA, prepared and mailed participating agency invitation letters to 80 agencies with a potential interest in the project in September 2009. The identification of potential participating agencies built on the list of agencies identified through the AA process.

The responsibilities of these agencies include, but are not limited, to:

- Participating in the NEPA process starting at the earliest possible time, especially with regards to the development of the purpose and need statement, range of alternatives, methodologies, and the level of detail for the analysis of alternatives.
- Identify, as early as practicable, any issues of concern regarding potential environmental or socioeconomic impacts of the project.
- Participate in the issue resolution process, described in the Coordination Plan.
- Provide meaningful and timely input on unresolved issues.
- Participate in the scoping process.

Accepting the designation as a participating agency does not indicate project support and does not provide the agency with increased oversight or approval authority beyond its statutory limits.

Participating agencies for the project are listed in Appendix C and include federal, state and local agencies with an interest in the project because of an overlap in their area of jurisdiction or some specialized knowledge of potential project effects. Invited federal agencies automatically become a participating agency unless they decline the invitation in writing, while local and state agencies much accept the invitation. The final list of participating agencies then includes federal agencies that both accepted and did not decline as well as state and local agencies that accepted the invitations.

Agencies were given 30 days from the date of the letter to respond. Agencies may also request to be added at any time during the process. Appendix D contains two sample invitation letters; one that was sent to federal agencies and tribes and one that was sent to state, regional, and local agencies.

2.4.2 Cooperating Agencies

Cooperating agencies are, by definition in 40 CFR 1508.5, federal agencies with jurisdiction, by law or special expertise, with respect to any environmental impact involved in the proposed project. A state or local agency of similar qualifications may, by agreement with the lead agency, also become a cooperating agency. The cooperating agencies are by definition participating agencies as well, and while the roles and responsibilities of both are similar, the cooperating agencies have a slightly greater degree of authority, responsibility, and involvement in the environmental review process.

The Federal Highway Administration (FHWA) has requested to become a cooperating agency for the Red Line Extension project because of their jurisdiction over the portion of the proposed alignment that would be located in the median of Interstates 94 and 57.

2.4.3 Agency Scoping Meeting

One Agency Scoping meeting was held as follows:

Time: Thursday, September 24, 2009, 10:30 A.M.

Location: CTA Headquarters, Conference Room C
567 W. Lake Street
Chicago, IL 60661

Attendees: 19, representing the following agencies and jurisdictions (sign-in sheet included in Appendix E):

- Illinois Department of Transportation (IDOT)
- Metra
- Metropolitan Water Reclamation District
- City of Chicago, Department of Community Development
- Chicago Department of Transportation
- Pace
- City of Detroit, Department of Transportation
- Illinois Commerce Commission
- Chicago Police Department
- Illinois State Police, Chicago District
- Chicago Park District
- City of Chicago, Streets and Sanitation
- Chicago Department of Environment
- Illinois Secretary of State Office

CTA hosted and presented the meeting with FTA present to observe. The meeting included a PowerPoint presentation similar to the one shown at the public scoping meetings and described in Section 2.5.4.1 with some additional information on the AA process.

2.4.3.1 Agency Scoping Meeting Comments

The topics addressed in the question and answer session included:

- A discussion of the capital cost estimates for each alternative and proposed funding sources.
- Effects of land acquisition.
- Coordination with other service providers.
- Opportunities to connect CTA and Metra at 115th and 130th.
- Opportunities for an intermodal station at 130th.
- Effects on Pace bus routes, access, and connections.
- Need to analyze bus effects for both build alternatives.
- Effects on bike access.
- Locations of grade separations and potential effects on bus service and street access.
- Use of green technologies.
- Coordination with wastewater treatment operations.
- Design of terminal at 130th Street.
- Effects of odors from sludge processing operations at adjacent property owned by the Metropolitan Water Reclamation District of Greater Chicagoland (MWRDGC) at 130th Street station.
- Potential reconfiguration of 95th Street Station.
- Safety and Security.
- Maintenance of access to expressway on-ramp during construction.
- Need for coordination regarding ongoing patrolling of facility.
- Cost of providing security.
- Management of contaminated debris during construction.
- Effects to wetlands.
- Coordination with/potential benefits to new environmental center at 38th and Torrence.
- Discussion of potential schedule for EIS, PE, and construction, and the EIS decision process.

The agency scoping meeting minutes are included in Appendix E.

2.5 Public Scoping

Public scoping is an important element in the process of determining the focus and content of an EIS. Scoping helps to identify the range of actions, alternatives, environmental effects, and mitigation measures to be analyzed in depth, and helps eliminate from detailed study those issues that are not pertinent to the final decision on the proposed project. Scoping is an effective way to bring together and address the concerns of the public, agencies, and other interested parties.

Notification of the public scoping meetings was completed via several forms of media as described further in this section. This outreach was in addition to the official notice published in the Federal Register. Two public scoping meetings were held as described in Section 2.5.4.

2.5.1 Notification Database

CTA maintained and updated the stakeholder database developed during the AA study to track interested individuals and groups. To the extent possible, CTA includes mailing addresses as well as e-mail contact information on the database. The database includes those who participated in the early scoping AA process by attending a meeting or providing comment during the process.

In addition to those identified through the AA process, the notification database was expanded to include residents and businesses adjacent to the proposed build alternative alignments. Addresses for businesses and residences on parcels either immediately adjacent to the proposed alignment or separated from the alignment by a street, park, vacant parcel, or one residence, were also added to the notification database. Parcels on both the east and west sides of the UPRR right-of-way were included. Parcels adjacent to both sides of the Halsted Alternative alignment were also included.

At the time of the scoping meetings, 4,265 entries were listed on the Red Line Extension project database. A list of the public agency database entries is provided in Appendix F.

2.5.2 Public Notification Activities

In order to engage the public to participate in the environmental review process and attend a scoping meeting, some basic strategies were used including: 1) make it easy to participate, 2) provide easy-to-understand information that helps people provide informed scoping comments and 3) provide multiple ways to obtain information and provide comment and ensure stakeholders are aware of the planning process and are shown how public input will be used.

Invitations were mailed directly to people on the project mailing list and e-blast invitations were sent to the e-mail distribution list. Newspaper display ads were placed in a total of 9 publications, transit cards were placed on CTA vehicles and in transit stations, and flyers were placed at strategic locations in the project area. Additionally, a project web page was developed to provide all of the project information and pertinent scoping information.

Prior to developing notification materials, an evaluation was conducted of the languages spoken within census tracts within the project area with an emphasis on identifying populations with limited English proficiency. The proposed Red Line extension LPA crosses 12 census tracts. In two of those tracts the percentages of Spanish speakers who speak English “less than very well” were 15 percent and 22 percent. In the other tracts and for other languages, the percentages were all below 3 percent for people who speak English “less than very well”. Therefore, the notification and scoping materials were provided in English and Spanish for the Red Line extension project.

2.5.2.1 Direct Mail Notice

Scoping meeting invitations were mailed on September 1, 2009 to a list of 4,265 entries that included elected officials, government agencies (including local agencies not described in Agency Scoping discussion in Section 2.4), tribes, general interested persons, businesses, organizations, neighborhood associations and property owners adjacent to both sides of the proposed build alternatives routes. The notice provided information on scoping, the alternatives, how to provide a comment, and the public scoping meeting information. The mailed invitation included information in English and Spanish. (Appendix G).

2.5.2.2 Transit Cards

In order to reach a large audience of transit riders, "transit cards" or "car cards" with the public scoping meeting information were placed in various buses and stations in the project area. (Appendix G) Approximately 691 transit cards were distributed on September 4, 2009 for posting at all Red Line stations and on bus routes originating from the 103rd Street Garage.

2.5.2.3 E-mail Notification

An invitation e-mail was created that included information on the public scoping meeting and how to provide comments. The e-mail was sent to approximately 323 addresses to people who had previously demonstrated an interest in the Red Line extension on September 5, 2009. A copy of the e-mail notification is included in Appendix G.

2.5.2.4 Newspaper Advertisements

To invite the public to the scoping meeting and notify individuals about the comment period, display advertisements for the scoping meetings were placed in nine newspapers within the project area. Newspapers were selected based on their geographic focus, language needs, and audited circulation numbers. Display ads ran during the week of September 8, 2009 through the week of September 18, 2009. Ads were placed in different papers on different days of the week throughout the notification period. Ads were placed in the two papers with the largest circulation twice, running a week apart. In addition, a legal notice was placed in the Chicago Tribune on September 8, 2009. The display ads and legal notice are included in Appendix G.

Table 2-1. Newspaper Display Advertisements

Newspaper	Ad Size	Geographic Coverage	Language	First Ad Date	Second Ad Date
Chicago Sun-Times	1/4 page	Region	English	Tues, 9/08/09	Tues, 9/15/09
Hoy	1/4 page	Citywide	Spanish	Fri, 9/11/09	--
RedEye	1/4 page	Citywide	English	Wed, 9/09/09	--
La Raza	1/4 page	Citywide	Spanish	Sun, 9/13/09	--

Legal Notice: Tribune	N/A	Region	English	Tue, 9/08/09	

Source: CWC Transit Group

2.5.2.5 Project Web Site

A project web site, www.transitchicago.com/redEIS/, was developed for the Red Line EIS. The site includes information about the project, the environmental review process, and the scoping information. The site also included information about how to submit scoping comments and who to contact for additional information. The web site prominently featured the dates and times of the public scoping meetings, as well as links to directions using public transit to access the meeting locations. Website content included the scoping booklets, presentations made at the public scoping meetings, and other information of interest to the public from the AA process. The website will continue to be updated at key milestones. Some materials posted to the website were translated into Spanish.

2.5.2.6 Additional Outreach During Public Scoping Period

In order to maximize the coverage of the outreach effort for the scoping meetings, a media release (Appendix G) was sent to local press outlets, meeting announcements were posted on local on-line community calendars, and flyers (Appendix G) were put in key locations around the area. The meeting announcement was distributed to the following village hall and library locations:

- City of Burnham
- City of Blue Island
- City of Calumet
- Village of Calumet Park
- Village of Dolton
- Village of Evergreen Park
- Village of Riverdale
- Altgeld Branch Public Library

- Blue Island Public Library
- Brainerd Branch Public Library
- Calumet City Public Library
- Hegewisch Library Branch
- James F. Vodak/East Side Branch Public Library
- Jeffrey Manor Branch Public Library
- Pullman Public Library
- Riverdale Public Library
- South Chicago Library Branch
- Tuley Park Library Branch
- Walker Branch Public Library
- West Pullman Library Branch

2.5.3 Elected Official and Stakeholder Briefings

There were four briefings with elected officials or stakeholders held on the Red Line Extension project. Generally, briefings covered a description of the project and the scoping process. The briefings included the following:

- Office of Alderwoman Austin, 34th Ward, September 15, 2009.
- Office of Alderman Beale, 9th Ward, September 14, 2009.
- Office of U.S. Representative Jesse Jackson, Jr., September 22, 2009.
- Roseland Business Development Council, October 10, 2009.

2.5.4 Public Scoping Meeting

CTA hosted two public scoping meetings to inform the public about the project and gather input on the scope of the environmental studies, draft purpose and need, and alternatives to be evaluated. Meetings were conducted in compliance with NEPA guidelines, and locations were selected to reflect equitable geographic coverage, proximity to public transportation, and to minimize overlap with other meetings scheduled in the project area. The locations were within the project area, accessible by public transit, and ADA compliant. The scoping meetings were set approximately five weeks in advance of the end of the public comment period on October 27, 2009.

For the convenience of all attendees, bus lines to and from the meeting sites were publicized on some notices and on the website. In order to provide the greatest opportunity for community participation, meetings were scheduled in the early evening on weekdays.

A total of 173 people signed in at the two meetings. There may have been a few additional attendees at each meeting who did not sign in. Approximately 35 people provided verbal and/or written comments at the meetings. An additional 309 comments were received via letters, e-mail, and mailed comment cards throughout the public scoping period.

Meeting 1:

Time:	Tuesday, September 22, 2009, 6:00 to 8:00 p.m.
Location:	Historic Pullman Visitor Center 11141 S. Cottage Grove Avenue Chicago, IL 60628
Attendees:	87 people signed in
Comments:	11 verbal, 2 written

Meeting 2:

Time:	Thursday, September 24, 2009 from 6:00 to 8:00 p.m.
Location:	Woodson Regional Chicago Public Library 9525 S. Halsted Street Chicago, IL 60628
Attendees:	81 people signed in
Comments:	17 verbal, 5 written

2.5.4.1 Public Scoping Meeting Format

The scoping meetings began with a 45-minute open house format. During the open house session, project team members were present at project display boards to answer questions related to the technical aspects of the project. The open house session provided attendees with an opportunity to review the project information and clarify their understanding of the project and environmental process prior to the start of the presentation and subsequent comment period. Spanish and sign language interpreters were made available at both meetings. Following the open house period, a PowerPoint presentation was made to provide attendees with information regarding the purpose of scoping and information on the project purpose and need, background, the recently completed AA process, and the alternatives being carried forward into the DEIS (Appendix I). Emphasis was placed on the importance of the community providing comments before the comment deadline, at the public meetings or via e-mail, fax, or postal mail.

Following the presentation, the meeting shifted into a formal public comment session, which was recorded by a court reporter. Members of the public provided verbal comments to CTA on the scope of the EIS and the project which were recorded in formal transcripts (Appendix K). Comments were also accepted by comment sheets at the meeting and by mail, fax, and e-mail after the meeting until the close of the comment period on October 27, 2009. The oral comment period was moderated, and speakers were asked to limit their comments to three minutes. Those requiring translation were provided with six minutes. After the public comment portion of the meeting, the project team was again available to answer technical questions at the informational display boards until the end of the meeting time.

Agenda:
6:00-6:45 pm Open House
6:45-6:55 pm Presentation

6:55-7:55 pm Public Comments
7:55-8:00 pm Next Steps/Adjournment

2.5.4.2 Public Meeting Materials

Each meeting attendee was offered the following materials: an EIS scoping information booklet, a comment sheet, and a speaker card (Appendix H). The scoping information booklet provided a project overview and included the following sections: purpose of the EIS and scoping, environmental issues to be considered in the EIS, project overview, project alternatives, project purpose and need, public participation, how to participate in the decision-making process, and next steps. This scoping information booklet was also available in Spanish and was posted on the project web site.

The comment sheet allowed attendees to submit written comments during or after the meeting. The comment sheet was designed as a self-mailer so that individuals could easily mail comments to CTA if they needed more time to develop them after the public scoping meeting (Appendix H). The speaker card was provided for attendees to fill out and turn in before or during the public comment session if they wanted to give verbal comments. The speaker cards were provided to the hearing facilitator and names were announced to allow people to approach the microphone to make a comment (Appendix H).

Project exhibit boards were developed and used during the public open house part of the meeting. The boards included: No-Build Alternative, the Transportation System Management Alternative, the Locally Preferred Alternative, the Halsted Street Heavy Rail Transit (HRT) Alternative, Project Purpose and Need, How to Submit Comments, How to Stay Involved, Welcome to the Meeting, Environmental Review Process, Issues Potentially Considered in the Environmental Impact Statement, Meeting Agenda, and the Project Timeline (Appendix J). Exhibit boards were also posted on the website.

2.6 Comments Received

The public scoping period was from September 1, 2009 to October 27, 2009 which was greater than the 45 calendar days required by FTA rules. People were provided opportunities to comment in writing or orally at the two public scoping meetings or they could comment in writing via e-mail, fax, or postal letter. The comment cards distributed at the public meetings were designed to facilitate return of written comments both at the public meeting and via postal mail later during the public comment period. E-mail comments could be sent to a project specific e-mail address found on the project website and included in all notice materials distributed. In total, approximately 344 comments were received by the close of the public comment period. All comments received are included in Appendices K, L, and M.

At the September 22nd public scoping meeting, 87 people signed-in, 11 people made formal public comments and 2 submitted written comments by the end of the meeting. At the September 24th public scoping meeting 81 people signed-in, 17 people made formal public comments and 5 submitted written comments by the end of the meeting. An additional 309 written comments were received on the Red Line Extension project by the close of the public comment period.

Section 3
Summary of Scoping Comments

3.1 Introduction

CTA accepted comments on the Red Line Extension project throughout the entire scoping period, from September 1, 2009 until October 27, 2009. Agencies, community groups, members of the public, elected officials, and other interested parties submitted 344 letters, e-mails, comment cards, and individuals' oral testimony during this period. The summary table (Table 3-1) provides a tally of the topics discussed in the comments.

It should be noted that the combined numbers of comments listed in the following subsections and the summary table will be greater than the total number of comment submissions because some people discussed multiple topics in their submission. Topics covered in the comments included the purpose and need, the alternatives to be analyzed in the DEIS, potential impacts and mitigation measures, and other substantive issues. This section contains a summary of comments received during the scoping period. The actual comments may be found in Appendices K, L and M.

3.2 Summary of Substantive Comments

All comments were reviewed and categorized in an electronic database. The database contains information documenting the name of the commenter, the agency or organization the commenter represented, the method by which the comment was received, the topic categories addressed in the comment. The full text of each comment is included in Appendices K, L, and M.

The comments were largely fit into three topic categories. The major categories of comments were the project purpose and need (approximately 7 comments), the alternatives to be studied in the DEIS (including alignment options, station location options, and potential design features; approximately 326 comments), and environmental impacts and mitigation measures (approximately 37 comments). The following sections contain summaries of the comments from each major category.

Table 3-1 provides a summary of the comments received during the scoping period. Transcripts of the spoken comments submitted at the public scoping meetings and full text of all written public comments are provided in Appendices K and L. Agency comments are provided in Appendix M.

Table 3-1 Comment Summary

Purpose and Need	Ease congestion in the region Improve transit access to and from Far South side Reduce congestion at 95th and Dan Ryan terminal Provide connections to transit disadvantaged communities		
Proposed Alternatives	Support No-Build (0) Support TSM (0)	LPA – UPRR HRT Alternative(318) Support (317) Do Not Support (1)	Halsted Street Alternative(3) Support (3) Do Not Support (0)
Design Comments	Stations (326) Extension should connect to Altgeld Gardens at 130th Provide bike access and parking Parking facilities should be larger Parking facilities should be smaller Parking should be at church lots Station design needs to accommodate bus access	Design Features (12) Recycling stations Use alternative energy Lighting design to reduce light pollution Natural stormwater management Native landscaping Green roofs Bike access and parking	Design Features (cont) Use permeable paving Incentives for alternate fuel vehicles Adequate bus bays for Pace, CTA, Paratransit Operator facilities Passenger information Signal priority for bus access
Other Alternatives	1. One way loop 2. Leave the UPRR right-of-way at 115th Street or Kensington Avenue, travel east to the Metra Electric line, cross over the electric line and turn south onto the IHB right-of-way	3. Use the alleys to the east of South State Street or South Michigan Avenue 4. Extend electric line routes to connect with an Indiana-Illinois border parking lot	5. Use I-94 and/or I-57 for the extension 6. Use of the Green Line from Stony Island to I-94 and South to 159th Street 7. A 9.5 mile one-way loop with seven stations
Potential Impacts	Transportation Impacts (21) Land Acquisitions, Displacement and Relocations(14) Community and Neighborhood Impacts (21) Visual and Aesthetic Impacts (6) Noise and Vibration (9)	Parklands (3) Economic and Fiscal Impacts (7) Safety and Security (8) Environmental Justice (284) Construction Impacts (8) Public Services (3)	

Note: Tallies are approximate

3.3 Comments Related to Purpose and Need

Most comments regarding the purpose and need for the project cited the benefits of the rail extension. In total, approximately 7 comments related to purpose and need were received. The general topics that these comments addressed were:

- Easing congestion in the region.

- Providing more transit options.
- Reducing bus congestion at the 95th and Dan Ryan Terminal.
- Providing connections to transit disadvantaged communities.

3.4 Comments Related to Alternatives

An approximate total of 326 comments specifically discussed the alternatives. The majority of the comments, approximately 317, supported the Locally Preferred Alternative (LPA) - Union Pacific Railroad (UPRR) Heavy Rail Transit (HRT) Alternative. Most of the comments in support of the LPA also noted that the extension should reach the Altgeld Gardens/Calumet River area at 130th Street, which is already a feature of the Locally Preferred Alternative. Many comments simply indicated a preference for the Locally Preferred Alternative without indicating the reason for their choice. One comment opposed the extension citing relocation impacts, and potential effects related to property values, traffic, and noise. A few comments mentioned other alignments. There were no comments specific to the no build or the TSM alternative. Three comments expressed support for the Halsted Street HRT Alternative as an approach that would have less impact on existing residences. However, even these comments mentioned the need for the extension to reach the Altgeld Gardens area.

3.4.1 Locally Preferred Alternative (LPA)

Approximately 317 comments were received expressing a preference for the LPA. Comments on this alternative included:

- Need for the extension to reach the Altgeld Gardens area.
- Potential to enhance neighborhoods by easing congestion and providing more transit options.
- Potential impact of land acquisitions, displacements and relocations due to the new extension and the park and ride facilities.
- Potential impacts related to construction.
- Potential noise and vibration impacts.
- Potential impacts to parking, bicycle and pedestrian circulation, bus access and routes.
- Potential to increase foot and vehicle traffic around the stations.
- Potential to increase litter and crime around the stations.
- Potential to provide options to transit disadvantaged population.
- Provides the greatest potential to mitigate traffic congestion feeding in from the south.
- Concerns about neighborhood compatibility.
- Potential impacts to parklands.
- Potential energy usage effects.
- Potential for brownfields redevelopment.

- Potential lighting and shadow effects.
- Potential for economic development.

3.4.2 Halsted Street Heavy Rail Transit (HRT) Alternative

Three comments were received supporting the Halsted Street Heavy Rail Transit (HRT) Alternative. Two of those comments included the refinement that the alternative should still reach the Altgeld Gardens area.

3.4.3 Station Locations and Connections

Approximately eight comments suggested station locations and connections that the Red Line Extension could make. The comments pertaining to station locations and connections included:

- Extension should connect to the Altgeld Gardens/Calumet River area at 130th Street.
- A station at 115th or Kensington to provide an easier connection to Metra and the South Shore.
- Concerns about providing bicycle access and parking.
- A suggestion to increase the proposed parking at the large park-and-ride facilities.
- Reduce the number of large park-and-ride stations and place more reliance on PACE bus services to get to the train.
- Use church parking lots instead of constructing new park-and-rides in the vicinity of the four station stops of the extension.

3.4.4 Other Alignments

CTA received approximately eight comments suggesting alignments for the Red Line Extension other than the LPA Alternative. These suggested alignments included:

- A one-way loop alternative.
- An alignment that leaves the UPRR right-of-way at either 115th Street or Kensington Avenue traveling east to the Metra Electric line, crossing over the electric line and turning south onto the IHB right-of-way.
- An alignment that uses the alleys to the east of South State Street or South Michigan Avenue.
- Extension of the electric line routes to connect with an Indiana-Illinois border parking lot.
- Use of I-94 and I-57 for the extension.
- Use of the Green Line from Stony Island Avenue to I-94 and South to 159th Street.
- A 9.5 mile one-way loop with seven stations.

3.4.5 Design Features

Approximately twelve comments were submitted suggesting additional design features to be taken into consideration. Suggestions regarding design features were primarily related to issues of sustainability. These features include the following:

- Recycling opportunities at stations and parking areas.
- Alternative energy options including solar, solar thermal, wind and more to provide electricity and heating/cooling.
- Solar arrays (on rooftops and large expanses) to return energy to the grid.
- Downward facing lighting to reduce light pollution.
- Bioswales and rain barrels.
- Native landscapes with little to no irrigation.
- Green roofs.
- Bicycle access and parking.
- Permeable paving for the park-and-ride areas.
- Charging stations for electric vehicles.
- Include sufficient bus bays at the stations to accommodate both Pace fixed/express routes, Regional ADA Paratransit services, and CTA bus routes.
- Include bus operator facilities and passenger information as well as bus priority access such as transit signal priority or bus-activated signals to allow buses to enter/exit the terminal with minimal congestion.

3.5 Comments Related to Potential Impacts

Approximately 37 comments received pertained to specific potential impacts of the project. Commenters discussed a wide range of potential impacts, though the majority touched upon relocations and displacements, safety, community compatibility, and transportation related issues such as traffic, parking, and bike and bus access to park and rides. The comments on each type of impact are summarized in the following subsections.

3.5.1 Transportation Impacts

Approximately 21 comments touched on potential transportation impacts including potential impacts to traffic circulation, parking, and access to park and rides by bikes, buses, and pedestrians. Comments included the following issues:

- Need for immediate relief of congestion at the 95th/Dan Ryan Terminal.
- Need for easy access for first responders such as police, fire and medical response during an emergency.
- Potential impacts related to increased foot and vehicle traffic.
- Arterial roadway access to/from the proposed station(s) served by connecting bus services need review for issues such as railroad grade crossings, street parking, and intersection improvements to accommodate bus movements.
- Suggestions for location and sizing of park and rides (both larger and smaller), and an

alternative to use church parking lots for commuter parking rather than new construction.

- Potential impacts to neighborhood parking if park and ride fills up.
- Extension will increase transit options for users.
- Need to increase bus service including night owl service.
- Reductions in travel times for bus riders.
- Use of bus services to access rail line.
- Potential effects on traffic patterns and congestion in a larger regional context.

3.5.2 Land Acquisition, Displacement, and Relocations

Fourteen comments about land acquisition, displacement, and relocations were received. The issues addressed in these comments include concern from the potential impacts to houses around the stations and extension. Comments included the following issues:

- Potential for property loss due to the construction of the stations, park and ride lots, and the extension line.
- Potential to impact homes on Eggelston Street.
- Potential to impact homes on the east side of the tracks.
- Potential to impact industry and businesses on the west side of the tracks.
- Reluctance of senior residents to relocate.

3.5.3 Community and Neighborhood Impacts

Twenty-one comments about neighborhood compatibility and potential community impacts were received. The comments focus on the potential impacts to the neighborhoods due to construction and operation of the Red Line Extension. Comments included the following issues:

- Potential to enhance neighborhoods.
- Potential for transit-oriented development.
- Issues of compatibility between commuter rail and residential neighborhoods.
- Operational impacts on residential character. Concerned that the construction and operation of the project will cause adverse impacts to the residential character of the community.
- Potential increased safety issues for residents near the extension.
- Disruption to senior citizens in the project area.
- Potential loss of residential homes.
- Potential effects of lighting around the stations and tracks.
- Potential loss of residential street parking due to transit riders parking in the

neighborhoods.

- Potential impact to residences on Eggelston Street including relocation, property values changes and increased traffic.
- Potential effects related to redevelopment of brownfield sites, such as environmental or human health risks.
- Effect of increasing transit access to transit disadvantaged communities.
- Potential to support and revitalize underserved communities.

3.5.4 Visual and Aesthetic Impacts

Six comments about visual and aesthetic impacts were received. Comments were primarily related to the potential for light impacts. One comment noted the potential for the trestle on Halsted Street to cause dark shadows and blight the area. Another comment mentioned the potential for an elevated track in back of homes to create dark areas and a visual impact.

3.5.5 Noise and Vibration

Approximately nine comments about noise and vibration were received. The issues addressed in these comments included noise and vibration from the trains moving along the tracks and potential damage to surrounding buildings due to vibration. One comment requested that the CTA do a full-scale investigation of the "best available" and "best practicable" noise mitigation technologies.

3.5.6 Parklands

Three comments about parkland and recreational facilities were received. Comments noted potential impacts to both Wendell Smith Park and Fernwood Parkway Park. In addition, one comment noted the potential opportunity to provide better access to the Ford Calumet Environmental Center.

3.5.7 Economic and Fiscal Impacts

Approximately seven comments received concerned the economic and fiscal impacts of the project. These comments included the following issues:

- Potential to increase labor productivity as a result of mitigating car congestion and reducing travel times to work for residents of the far south side of Chicago and south suburbs.
- Concerns about the project costs compared to other projects across the country.
- Potential impact to property values of the homes near the extension.
- Potential to disrupt businesses during construction.
- Potential beneficial impact of transit investment on job creation and increasing employment opportunities.
- Employment model should demonstrate benefits to working populations in project area. Concern that the project will not provide jobs to the people in project area.

- Several suggested design variations were mentioned as potentially being lower cost options.
- Opportunities for transit oriented development and/or commercial and retail services near proposed stations and park and rides.
- Concerns about funding sources and maintenance and operation costs.

3.5.8 Safety and Security

Eight comments about safety and security were received. Comments included the following issues:

- Ability of first responders to access construction areas.
- Concerns that lighting around stations and along the rail line be adequate to discourage crime. Potential for the trestle on Halsted Street to create shadows.
- Potential impact for increased crime at stations and surrounding neighborhoods.

3.5.9 Environmental Justice

Approximately 284 comments were received that focused on the benefits of the proposed project to transit disadvantaged communities (communities underserved proportionally by transit investment). One comment referred to potential air quality benefits that might accrue to the low income community at Altgeld Gardens. Several comments specifically mentioned environmental justice as a potential goal or benefit of the project. Approximately five of the comments referred to a potential for or concern about brownfields development to mitigate the effects of contamination within the project area and effects of hazardous materials on disadvantaged communities. Some specific comments included:

- EIS needs to demonstrate compliance with environmental justice principals.
- Employment model should demonstrate benefits to working populations in project area.
- Potential for environmental justice issues related to job creation and increased employment opportunities.
- Effect of increasing transit access to transit disadvantaged communities.
- Potential to support and revitalize underserved communities.
- Reluctance of senior residents to relocate.

3.5.10 Construction Impacts

Eight comments about construction effects were received. Comments included the following concerns:

- Potential for an increase in termites and rodents in neighboring homes and structures during demolition.
- First responders need access to and through construction zones.
- Potential for construction vibration to damage nearby homes.

- Potential impacts of construction noise.
- Potential disruption of neighborhood traffic patterns and parking
- Construction duration.

3.6 Comments Submitted by Federal, State, and Other Agencies

Seven agencies submitted comments during the scoping period. Most of the topics mentioned were also covered in the comments discussed in the previous sections. However, some of the agency comments presented new issues, including requests to ensure compliance with government-mandated policies and regulations, coordination among transit providers, and safety concerns. The agency comments are summarized in the following sections, and full text of the agency comments is provided in Appendix M. The concerns of all the agencies will be addressed both through the DEIS analysis and through on-going coordination with CTA.

There were no comments from federal agencies. Comment letters were received from two state agencies, one regional transit provider, and four City of Chicago agencies.

3.6.1 Comments Submitted by State Agencies

The Illinois Environmental Protection Agency did not have any objections to the proposed project and highlighted the future need to obtain construction permits for construction stormwater management and the potential need to obtain permits from the US Army Corps of Engineers if there would be any in-water work. The Illinois State Police highlighted concerns for first responders including access to construction zones and access to elevated tracks.

3.6.2 Comments Submitted by Other Agencies

The Pace suburban bus service, the City of Chicago Department of Streets and Sanitation, Chicago Department of Environment, Chicago Housing Authority, Chicago Police Bureau of Patrol, and the Metropolitan Water Reclamation District of Greater Chicago (MWRD) submitted comments covering some of the topics mentioned in previous sections, as well as:

- Evaluate opportunities for sustainability actions such as recycling stations, use of solar energy, sustainable management of stormwater, incentives for use of fuel efficient or alternative fuel vehicles, and/or reuse and recycling of construction debris.
- Consider connections to the new Ford Calumet Environmental Center.
- Consider intermodal connections and providing connections between transit systems at proposed station stops at 115th and at 130th Streets.
- Evaluate potential impacts of construction and operation on the need for services from other City departments including staffing levels and specialized rail training.
- Evaluate impacts on street lights, street lighting levels, and street trees.
- Extension to Altgeld Gardens will improve city wide accessibility for transit dependent populations.
- Ensure safety of transit users by evaluating potential security risks from less used and isolated access points to train lines.

- Arterial road access to proposed stations should be evaluated for adequate grade crossings, street parking, and intersection configurations to accommodate connecting bus movements.
- Station design should include consideration of access requirements for both Pace and CTA bus routes and Regional ADA Paratransit, operator facilities, passenger information, and bus priority access.
- Evaluation of connecting bus service to new stations should consider likely route restructuring that would occur to reduce service overlap.
- Design will need to maintain access to MWRD facilities, evaluate potential impacts to operations, and coordinate with utility locations.
- Potential use of MWRD property for proposed stations and park and ride facilities at 130th Street would require agreements with MWRD.
- Evaluate impacts to wetlands potentially located in the vicinity of the proposed 130th Street station.
- Evaluate potential effects of odors from MWRD facilities on proposed transit facilities.

Section 4
Responses to Comments

4.1 Introduction

The purpose of scoping is to provide an opportunity for agencies and the public to comment on the purpose and need, the range of alternatives proposed for analysis, and to help the project proponent identify issues that should be evaluated in the DEIS analysis. Therefore, all comments that fall within the scope of the NEPA process will be addressed in the DEIS. CTA will also continue to work closely with agencies and stakeholder groups to address issues identified through scoping.

4.2 Comments Related to Purpose and Need

There were no comments directly related to the stated purpose of the project. A number of comments did affirm many of the previously identified needs for the project. In addition, some commenters identified additional conditions or benefits that support the need for the project. The DEIS will expand and clarify the purpose and need statement in response to these comments.

4.3 Comments Related to Alternatives

Many commenters expressed a preference for the LPA because it would enhance neighborhoods, ease congestions and provide better transit options for users. Comments that included reasons for a stated preference also provide insight into potential impacts or benefits of all of the alternatives. These insights into potential impacts are helpful in guiding the impact analysis of the DEIS. Comments that provide this insight are also counted as a comment on a particular resource discipline and will be included in the analysis of potential impacts.

A few comments expressed a preference for an alternative that is not currently proposed for consideration in the DEIS. The DEIS will summarize alternatives previously considered and eliminated and the process used to do so. Alternatives that do not meet the project purpose and need will not be evaluated further.

4.4 Comments Related to Potential Impacts

Potential impacts or benefits of alternatives identified by commenters will be analyzed in the DEIS. Insights into how a particular alternative may affect traffic, neighborhoods and communities, safety, or accessibility in the project area and the region are a valuable result of the scoping process. Many comments reflected an awareness of the transit dependency of the communities in the project area and hope for potential benefits to disadvantaged populations that may result from the project. Specific comments on each potential impact will be used to guide the analysis of the alternatives.

Specific comments on potential impacts were related to traffic circulation and congestion, parking issues, property acquisitions and relocations, safety, community and neighborhood compatibility, economic development opportunities, visual and aesthetic concerns, noise and vibration, and construction activities.

Overview

Red Line Extension

The Chicago Transit Authority (CTA) is proposing to make transportation improvements by extending the Red Line southwest from the 95th Street terminal station to 99th Street in the I-57 median, then turning south and southeast along or adjacent to the Union Pacific Railroad (UPRR) right-of-way until 120th Street, continuing southeast at-grade to 130th Street. CTA and the Federal Transit Administration (FTA) will be preparing an Environmental Impact Statement (EIS) that will evaluate the environmental impacts of constructing and operating the extension. The extension includes 5.3 new route miles of rapid transit to the existing Red Line, four additional stations – at 103rd, 111th, 115th and 130th Streets – with new park-and-ride and bus terminal facilities at each station, and 78 new railcars. CTA is investigating a shortened version of this LPA (to 115th Street) to evaluate potential improvements in cost-effectiveness.

The proposed project is intended to:

- Improve commute times for study area residents
- Improve access to the 95th Street station
- Alleviate congestion at the existing Red Line terminal station, where current use exceeds design capacity, resulting in delays, safety issues, and lack of transit attractiveness
- Reduce adverse impacts of projected growth to study area resident without transportation alternatives

Public Participation Plan

The National Environmental Policy Act (NEPA) requires evaluation of potential environmental impacts associated with federal projects and actions. For this project, the evaluation will be documented in an Environmental Impact Statement (EIS). An EIS will be prepared to identify impacts related to project construction and operation.

The EIS will cover a No Build Alternative, a Transportation Systems Management (TSM) Alternative and the Locally Preferred Alternative. The EIS will describe the alternatives, the existing environmental setting, the potential impacts from construction and operation of the alternatives and mitigation measures to reduce or eliminate potential impacts.

The Safe, Accountable, Flexible, Efficient Transportation Equity Act: A Legacy for Users (SAFETEA-LU) is an act that governs United States federal surface transportation spending and requires project proponents provide opportunities for public participation in transportation decision-making. SAFETEA-LU incorporates changes aimed at improving and streamlining the environmental process for transportation projects. It provides a framework for carrying out the existing requirements under NEPA and other laws.

The process of determining the scope, focus and content of an EIS is known as “scoping.” Scoping meetings are a useful opportunity to obtain information from the public and governmental agencies. In particular, the scoping process asks agencies and interested parties to provide input on the proposed alternatives, the purpose and need for the project, the proposed topics of evaluation, and potential impacts and mitigation measures to be considered.

Public Participation Plan for Next Phase

This Public Participation Plan covers activities and materials for the scoping phase only. An additional plan will be provided to outline public participation activities that will be done during the development and review of the Draft EIS and Final EIS.

Goals

The public participation plan is intended to guide the CTA through a comprehensive public involvement and outreach process for the Red Line Extension EIS scoping phase. The program is flexible in order to respond appropriately to public and agency issues as they arise. It is anticipated that additional information will become available that will further guide proposed activities. The dates and activities are preliminary and may change.

Two of the major goals of the NEPA environmental analysis process are to better inform governmental decisions and to enhance citizen involvement. With these goals in mind, the public participation program will:

PUBLIC PARTICIPATION GOALS
o Build on previous outreach efforts established during the Alternatives Analysis phase
o Make the complex issues associated with the proposed project and the environmental analysis understandable to stakeholders
o Ensure stakeholders are aware of the planning process and the purpose and content of the proposed project
o Provide a range of opportunities for the public and interested stakeholders to comment on the proposed project and environmental studies
o Fulfill the public participation requirements and guidelines of NEPA and the federal transportation reauthorization bill known as the Safe, Accountable, Flexible, Efficient Transportation Equity Act-A Legacy for Users (SAFETEA-LU)
o Document all public and agency input.

The public participation program provides a variety of communication channels to help the public understand the current scope of the study, including its impacts and benefits. The program will solicit input and feedback from the public as to their specific needs, issues, concerns, and recommendations. In order to engage the public to participate in the environmental review process, some basic strategies will be used in the public participation program.

STRATEGIES TO ENGAGE PUBLIC	⇨ APPROACH
o Make it easy to participate o Provide easy-to-understand information that helps people provide informed scoping comments o Provide multiple ways to obtain information and provide comment o Ensure stakeholders are aware of the planning process o Show how public input will be used	o Scoping meeting within the project area; Web access to all project information; outreach materials in English and Spanish o Straightforward Scoping Booklet, Web site, exhibit boards and handouts at meetings o Web site, mailed notice, e-blasts, community calendars, comment cards, media o Careful review and augmentation of the existing project mailing list o Stakeholder and Alderman/elected official briefings to identify issues and find additional ways to engage the local community o Document all public and agency input in the Scoping Meeting Summary Report; provide final report on Web site

Key Issues

As the study progresses, key issues will evolve and the appropriate public involvement approach to address key issues will be determined. An initial list of the key issues has been developed. The list will be amended and expanded as the study moves forward.

KEY ISSUES

General Issues/Community Concerns

- Public safety (schools, crime, crossings)
- Providing access to underserved communities (Altgeld neighborhood)
- Location/benefit of different station options
- Length of the study process
- Impact to Chicago Olympic bid
- Impact/enhancement on residential/business/school areas surrounding the project
- Effect/enhancement of quality of life
- Existing negative environmental conditions
- Noise/vibration for residents along corridor
- Potential reduction of greenhouse gasses vs. contribution to sprawl
- Accuracy of model data (ridership numbers)
- Suburban residents' image of CTA service

Economic Issues/Concerns

- Jobs/improved economy
- Project cost
- Funding
- Cost vs. benefits
- Local workforce participation
- Potential to take money away from other needed public projects
- Public transit effects on property values
- Support for local economic and land use plans and goals

Transportation Issues/Concerns

- Coordination/connectivity with other transit systems
- Project amenities for bike/pedestrian and transit users
- Impact of program on the other CTA services

Construction Issues/Concerns

- Length of construction
- Potential traffic/detours/delays
- Potential parking/relocation/displacement during construction
- Potential transit access/impacts on bus or transit stops

Key Audiences

Anyone who lives, works, plays, learns and commutes through the Red Line Extension project area, or has some involvement or oversight in how the line will operate, is an important audience member. The public participation program will create a structure for gaining an understanding of the different community interests and characteristics. The project is important to many different groups, each with specific interests in the study. The outreach team will keep these groups involved and continually informed about the process and progress of the analysis. Brief discussions of some key audiences follow.

Local Community

Reduction of impacts on residential areas and maintenance of neighborhood character are important issues for neighborhood organizations and homeowners. The public participation program will include outreach to property owners and residents around and adjacent to the extension. Some of the local communities that may be interested include the following:

- Altgeld Neighborhood
- Beverly Neighborhood
- Burnham Residents
- Chatham Avalon Park Community Council
- Chesterfield Community Council
- City of Blue Island Residents
- City of Calumet Residents
- Cottage Grove Heights Neighborhood
- Gardens Neighborhood
- Longwood Manor Neighborhood
- Morgan Park Neighborhood
- Neighbors of Fuller Park
- Princeton Park Neighborhood
- Pullman Neighborhood
- Roseland Neighborhood
- United Neighborhood Organization
- Village of Calumet Park Residents
- Village of Dolton Residents
- Village of Evergreen Park Residents
- Village of Riverdale Residents
- Washington Heights Neighborhood

Business / Business Associations / Institutions

Business interests vary along the corridor. Some business stakeholders value the extension's potential enhancement of employee and customer access to the region while others are concerned about its effects on individual business sites. This overall group includes the industries, local business leaders and chambers of commerce. The outreach will solicit ideas and concerns from the business community. Some of the local business groups that may be interested include the following:

- 87th Street Stony Island Chamber of Commerce
- 95th Street Corridor
- American Brotherhood of Contractors
- Association of Asian Construction Enterprises
- Black Contractors United (BCU)
- Blue Island Chamber of Commerce
- Bronzeville Chamber of Commerce
- Business and Economic Revitalization Association
- Calumet Area Industrial Commission
- Calumet City Chamber of Commerce
- Chatham Business Association
- Chicago Area Gay & Lesbian Chamber of Commerce
- Chicago Minority Business Development Council (CMBDC)
- Chicago Southland Chamber of Commerce
- Chicagoland Chamber of Commerce
- Cosmopolitan Chamber of Commerce
- Greater Auburn -Gresham Development
- Greater Southwest Development Corp
- East Side Chamber of Commerce
- Hegewisch Chamber of Commerce
- Hispanic American Construction Industry Association (HACIA)
- Illinois Hispanic Chamber of Commerce
- Illinois Sports Authority
- Latin American Chamber of Commerce
- National Association of Women Business Owners (NAWBO-Chicago Area Chapter)
- Predestined Incorporated
- Puerto Rican Chamber of Commerce of Illinois
- Rainbow Push Coalition, International Trade Bureau
- South Chicago Chamber of Commerce
- Southwest REACH Center
- St. Bernard's Hospital and Health Care Center
- Women's Business Development Center (WBDC)

Associations / Special Interest Groups / Schools

Sensitivity to the surrounding environment is important to developing an acceptable project. The input of various local, state, and federal agencies will be obtained throughout the environmental process. In addition, associations, special interest groups and schools will be consulted. Some of the key groups that may be interested include the following:

- Alianza Leadership Institute
- Apostolic Church of God
- Carver Military Academy
- Catholic Charities - Community Affairs and Civic Affairs
- Chicago State University, Office of Public Affairs
- Chicago Urban League
- Chicagoland Bicycle Federation
- Corliss High School
- Developing Communities Projects, Inc
- Firman Community Services
- Gwendolyn Brooks College Preparatory High School
- Harlan Community Academy High School
- Historic Pullman Foundation
- Illinois Institute of Technology
- Kennedy King College
- Metro Seniors in Action
- Morgan Park High School
- NAACP, Chicago Southside Chapter
- Northeastern University Center for Inner City Students
- Northwestern University
- Olive-Harvey College
- Percy L. Julian High School
- Pullman Civic Organization
- Pullman Historic Visitor Center
- Rainbow/Push Coalition
- Riverdale Community Resource Center
- Roseland Heights Community Association
- Roseland Heights Community Organization
- Rosemoore Community Association
- Salem Baptist Church of Chicago
- Senior Service Coalition of Southeast Chicago
- Simeon Career Academy
- South Shore Cultural Center
- Southeast Environmental Task Force
- St. Sabina Church
- Strategies for Community Economic Development & Finance
- Teamwork Englewood
- University of Chicago
- University of Illinois at Chicago -College of Urban Planning and Policy
- West Chatham Improvement Association
- YWCA

Commuters

Commuters are interested in the study as it relates to their daily commute. Key issues include traffic impacts and congestion, safety, and access. Advanced, timely information is important for this group.

Public Agencies and Local Government

Coordination and cooperation among agencies and all levels of government are an important element of this study. Some of the key agencies and local government representatives that may be interested include the following:

- Alderman, Ward 3
- Alderman, Ward 6
- Alderman, Ward 7
- Alderman, Ward 8
- Alderman, Ward 9
- Alderman, Ward 17
- Alderman, Ward 34
- Beverly Area Planning Association
- Chicago Housing Authority
- Chicago Roseland Development Corporation
- City of Blue Island
- City of Burnham
- City of Calumet
- City of Chicago Department of Community Development
- City of Chicago Department of Transportation
- Congressmen
- Cook County Commissioners
- South Suburban Mayors & Managers Association
- Southeast Chicago Development Commission
- State Representatives
- State Senators
- Village of Calumet Park
- Village of Dolton
- Village of Evergreen Park
- Village of Riverdale
- Village of Riverdale, Community Development Department

Media

Media coverage offers an efficient means of communicating with the general public. Effective coordination with local and regional media contacts will be crucial to raising public awareness and explaining the study. Supplying the media with updated, factual information increases the likelihood of balanced, informative coverage. Ethnic, multi-lingual media coverage will also be an important element of the media outreach. See Appendix C for a list of the media outlets.

Public Participation Activities

Stakeholder and Alderman/Elected Official Briefings

An initial task in the public involvement program will be to identify areas of agreement and conflict among various stakeholders. Individual meetings with key stakeholders will be informal but structured to obtain input on goals, objectives, key issues, preferred communication tools, and public policy considerations. Input obtained from the stakeholder briefings will be shared with the team and incorporated in the public participation program. The team will work with CTA to develop the list of key stakeholders that will be briefed.

Schedule:

Schedule Meetings:	End of August
Hold Stakeholders Meetings:	Between 9/9/09 and 9/29/09

Agency Scoping Meeting

An agency scoping meeting will be held to coordinate and facilitate work with the designated federal, state and local agencies. Agendas for all meetings will be prepared and discussions and agreements will be fully documented.

Location

- The meeting will be held at the CTA offices.

Schedule:

- Agency Scoping Meeting: 9/22/09

Public Scoping Meeting

The scoping meeting will first inform the public about the project process, the Locally Preferred Alternative, and the public participation plan. Then, the meeting will gather input on the scope of the environmental studies, draft purpose and need, and the alternatives to be evaluated.

Schedule:

- Public Scoping Meeting: Between9/23/09 – 10/2/09

Location

The meeting location will be within the project area and must meet FTA criteria. Locations will be identified in conjunction with the Aldermen in the project area.

The locations identified must meet the following criteria:

- The facility must have at least two large rooms – one room must be able to accommodate a theater type presentation that can hold at least 100 people and a second room must be available to comfortably accommodate the presentation boards, technical staff, and public
- Must be ADA accessible
- Near public transportation
- Free of charge

Format

The meeting will start with an open house format where members of the public and other interested parties can view exhibit boards with project information. This informal setting provides participants a chance to ask questions of project team members who understand the project objectives and alternatives.

The project team will be available to answer any questions during the open house and will encourage people to make formal comments in writing or during the comment session. A short PowerPoint presentation will follow, providing an overview of the Locally Preferred Alternative, the NEPA process, the purpose of scoping, and the potential environmental issues.

The meeting will end with a session where members of the public can provide oral comments on the scope of the EIS. Each presentation will be set up to accommodate 100 attendees. Comments may be provided at the meeting by comment cards and during the public comment session. A court reporter will take public comments and input at the meeting and document the formal comment session. In addition, material will be available with contact information for those who wish to submit written comments later during the scoping period.

Comments will not be addressed during the meeting. The purpose of the scoping meetings is to listen to people's concerns and to address them through the analysis in the EIS. CTA will not respond to comments during the open comment period. The open house portion of the meeting is intended to provide people an opportunity to ask questions and clarify their understanding of the project proposal.

Schedule:

- 6:00-6:45 pm Open House
- 6:45-7:05 pm Presentation
  - Welcome/Meeting Purpose and Format
  - Project Overview
  - Environmental Process, Scoping and Environmental Issues
- 7:05-7:55 pm Public Comments on Scope of EIS
- 7:55-8:00 pm Next Steps/Adjournment

Note: The scoping meeting will be advertised from 6:00 – 8:00 pm and the team and staff will stay until 8:00 pm, even if no members of the public are present. Also, the team and staff will not end the meeting until everyone who wishes to speak has had an opportunity to do so.

Public Participation Notification and Information Materials

Notice of Intent (NOI)

The publication of a Notice of Intent in the Federal Register is the first formal step in an EIS process. The Notice of Intent (NOI) will be sent by CTA, the lead agency, to notify agencies that it plans to prepare an Environmental Impact Statement (EIS).

Schedule:

- Publish NOI in Federal Register: 9/8/09
- Beginning of 45 day comment period: 9/9/09

Participating Agency Invitation Letters

Letters inviting agencies to be involved in the process will be prepared.

Schedule:

- Mail participating agency letters: 8/26/09

Public Scoping Invitation Notice

A one page mailer will act as an announcement for the meeting. It will include the meeting date, location and time, and will also provide basic information about the project, the environmental process, and date by which public comments must be submitted. The notice will be translated into Spanish and Polish.

Schedule:

- Mail scoping invitation notice (arrive 2 weeks in advance of meeting): 8/26/09

Other Notification (Village Hall, Libraries, Blogs, e-blasts, Transit Cards)

Notice of the scoping meetings will be posted and distributed throughout the area including at Village Halls, libraries, e-list serves and with community groups.

Schedule:

- Launch notification distribution: 8/26/09

Village Hall Announcement Posting Locations:

- City of Burnham
- City of Blue Island
- City of Calumet
- Village of Calumet Park
- Village of Dolton
- Village of Evergreen Park
- Village of Riverdale

Library Announcement Posting Locations

- Altgeld Branch Public Library
- Blue Island Public Library
- Brainerd Branch Public Library
- Calumet City Public Library

- Hegewisch Library Branch
- James F. Vodak/East Side Branch Public Library
- Jeffrey Manor Branch Public Library
- Pullman Public Library
- Riverdale Public Library
- South Chicago Library Branch
- Tuley Park Library Branch
- Walker Branch Public Library
- West Pullman Library Branch

Blogs

- Chicago Transit Board Chairman Carole Brown's "Ask Carole" blog
- Chi-Town Daily News
- CTATattler blog
- Gapers Block
- Ridge99.com
- southwestobserver.com
- thesixthward.blogspot.com

E-blasts

E-blasts will be sent to stakeholders, politicians and residents who went to the previous CTA meetings. We will obtain e-mail addresses for officials at key businesses and public buildings – such as post offices, schools, libraries, and courthouses – to make sure they receive the meeting information in a PDF format so they can print it out and post it.

Online calendars

There are many online event calendars, and most of them are run through newspapers or TV stations. Meeting notices will be sent to local chambers of commerce and to large organizations that cover a wide audience and would communicate with members in the areas served by the line, such as the Chicagoland Chamber of Commerce, Illinois Chamber of Commerce and the Association Forum of Chicagoland.

Promotion in Transit

The scoping meeting announcement will be posted at the CTA stations and in the CTA trains and buses via car cards.

Schedule:

Send scoping announcement to CTA	8/12/09
Post in vehicles	8/26/09

Social media

There are several opportunities for CTA to reach out via social media. We can post the meeting information on the CTA Facebook group page. Information can also be provided to movingbeyondcongestion.com. In addition, we can start a Facebook page for the Red Line Extension project, so that people can follow the progress of the project and offer their support. And, if CTA started Twitter accounts for the Red Line, followers could receive updates about what transpires at a public meeting, for example.

Web site

A new project site will be developed for the environmental phase. The Web site provides access to project updates, project background, project materials and documents and announcements. The scoping meeting dates will be posted in advance on the Web site.

Schedule:

- Develop Web site: June - August 09
- Launch Web site: 8/13/09
- Post Scoping Information 8/26/09

Scoping Display Advertisement/Legal Notice

A formal scoping display ad will be placed in local and regional newspapers. The ad will include information on the project, the environmental analysis, the scoping meeting agenda, the meeting information and where and when to submit comments. An e-mail and postal mail address will be provided for written comments. The team will coordinate with CTA as to the placement of ¼ page advertisements in local newspapers. The ad will also be prepared in Spanish. Below is a preliminary listing of the outlets.

Publication Placement:

- The Chicago Crusader
- Chicago Defender
- LaRaza
- Neighborhood Star
- Southtown Star
- Beverly Review
- The Villager

Schedule:

- Provide display ad text to CTA ten days prior to media publishing deadlines
- Place display ad: Two weeks in advance of meeting, 8/26/09

Media Release

Media outreach will be done to ensure that reporters are aware of the scoping meetings and have adequate background information with which to write about the environmental review process. The team will work with CTA to develop key messages and put together a press release and media advisory. See Appendix C for the media distribution list.

Schedule:

- Send media release to CTA two days in advance of media deadline for 9/16/09 publication
- Distribute media release: One week in advance of meeting, 9/16/09

Scoping Booklet

The scoping booklet will contain background information on the project and the NEPA process. The purpose of the scoping meeting also will be identified within the booklet. A map depicting the project location and a description of the project area will be included. The booklet will also include a section on how and where comments may be submitted. The scoping meeting date and location will be provided in the booklet. An electronic file (.pdf file) will also be produced for posting on the CTA website.

Schedule:
- Print scoping booklet: 8/31/09

Meeting Materials

Information boards for use during the open house part of the scoping meetings and general hand-outs will be prepared.

- **Boards:** Welcome, Project Area Map, Typical Cross Sections/Station Locations, List of Environmental Issues to be Studied, Environmental Review Process, How to Stay Involved/Submit Comments
- **Hand-outs:** Agenda, comment form, copies of the boards, scoping booklet

Schedule:
- Print/finalize Meeting Materials: 9/14/09

Frequently Asked Questions/Talking Points

A Frequently Asked Questions (FAQs) and talking points will be provided for use by CTA staff and the consultants to prepare them for the stakeholder meetings and scoping meetings.

Schedule:
- FAQ/Talking Points: 9/14/09

Project Database

A comprehensive database of all stakeholders for the Red Line Extension will be established and maintained, using CTA's existing database. The database will be updated regularly and supplemented as appropriate. The database will include elected officials, special interest group representatives, and agency staff. The mailing list will also include property owners and tenants adjacent to the centerline of the proposed project.

Schedule:
- Update Project Database: June/July 09
- Finalize for Invitation Mailing: End of July 09

Documentation

Comment Tracking/Documentation/Response Management

The scoping meetings will be fully documented for the administrative record in compliance with NEPA and SAFETEA-LU. Comments will be received by mail, e-mail, and by comment card and verbally at the scoping meetings.

Scoping Meeting Summary Report

A summary meeting report from the scoping meetings will be prepared. It will include comment cards, the court-reporter record of the scoping meeting, letters, attendance sheets, notification materials and a summary of verbal and written input, such that an evidential record of the meetings are documented. This meeting report will be incorporated into the formal scoping report.

Schedule:

- Finalize Report and Post on Web site: 10/27/09

CHICAGO TRANSIT AUTHORITY (CTA)

Appendix B
Notice of Intent

- Build Alternative 1; adding one general purpose lane in each direction.
- Build Alternative 2; adding two general purpose lanes in each direction.
- Build Alternative 3; adding one toll lane to the existing carpool lane in each direction that will be managed together (Federal Highway Administration tolling authority required); also adding one general purpose lane in each direction north of Euclid Street to I–605.
- Build Alternative 4; on I–405 from Euclid Street to I–605, providing additional general purpose lane at various locations and improving various interchanges.
- Transportation Systems Management (TSM)/Transportation Demand Management (TDM)/Mass Transit Alternative; making only low-cost operational improvements, rather than major capital projects, to maximize the efficiency of the present highway system and expand travelers' transportation choices.

Based on a Preliminary Environmental Analysis Report (PEAR) for the I–405 Improvement Project, it is anticipated that the project may require the following Federal permits: Section 404 Permit for filling/dredging waters of the United States and Section 401 Water Quality Certification. The environmental document will analyze factors that include, but are not limited to, the following: Aesthetics, cultural resources, biological resources, hazardous wastes and materials, public services and facilities, water quality, floodplain, noise, air quality, recreation, community impacts, and transportation/traffic. Some of these alternatives may have impacts on the above mentioned resources, as well as on water quality, cultural resources, parks/recreation facilities, and community character and cohesion; the environmental documentation process will assess for potential impacts and suggest ways to reduce or mitigate them.

This document is available at *http://www.octa.net/405improvement* and *http://www.dot.ca.gov/dist12/405/index.htm.*

Letters describing the proposed action and soliciting comments will be sent to appropriate Federal, State, Participating Agencies, various Tribal governments, and local agencies, and to private organizations and citizens who have previously expressed or are known to have interest in this proposal. The environmental review process will begin in Fall 2009. Public scoping meetings will be held in Fountain Valley, Huntington Beach, Westminster, and Rossmoor, California, on September 22, 23, 30, and October 01, respectively. In addition, a public hearing will be held. Public notice will be given of the time and place of the meeting and hearing. The draft EIS will be available for public and agency review and comment prior to the public hearing.

To ensure that the full range of issues related to this proposed action are addressed and all significant issues identified, comments, and suggestions are invited from all interested parties. Comments or questions concerning this proposed action and the EIS should be directed to Ms. Deshpande at Caltrans at the address provided above.

(Catalog of Federal Domestic Assistance Program Number 20.205, Highway Research, Planning and Construction. The regulations implementing Executive Order 12372 regarding intergovernmental consultation on Federal programs and activities apply to this program.)

Issued on: August 26, 2009.

Cindy Vigue,

Director, State Programs, Federal Highway Administration, Sacramento, California.

BILLING CODE 4910–22–P

DEPARTMENT OF TRANSPORTATION

Federal Transit Administration

Intent to Prepare an Environmental Impact Statement for Proposed Transit Improvements to the Red Line, Cook County, IL

AGENCY: Federal Transit Administration (FTA), Department of Transportation.

ACTION: Notice of intent to prepare an Environmental Impact Statement.

SUMMARY: The FTA, as the lead federal agency, and the Chicago Transit Authority (CTA) intend to prepare an Environmental Impact Statement (EIS) for the Red Line Extension Project in Cook County, Illinois. CTA operates the rapid transit system in Chicago, Cook County, Illinois. The proposed project, described more completely within, would extend the Red Line, a heavy rail transit line, to connect the 95th Street Station to 130th Street. The purpose of this Notice of Intent is to alert interested parties regarding the intent to prepare the EIS, to provide information on the nature of the proposed project and possible alternatives, to invite public participation in the EIS process.

DATES: Written comments on the scope of the EIS, including the project's purpose and need, the alternatives to be considered, the impacts to be evaluated, and the methodologies to be used in the evaluations should be sent to CTA on or before October 27, 2009. See ADDRESSES below for the address to which written public comments may be sent. Two public scoping meetings to accept comments on the scope of the EIS will be held on the following dates:

- Tuesday, September 22, 2009; 6 p.m. to 8 p.m.; at the Historic Pullman Visitor Center, 11141 S. Cottage Grove Avenue, Chicago, IL 60628.
- Thursday, September 24, 2009; 6 p.m. to 8 p.m.; at the Woodson Regional Chicago Public Library, 9525 S. Halsted Street, Chicago, IL 60628.

The buildings used for the scoping meetings are accessible to persons with disabilities. Any individual who requires special assistance, such as a sign language interpreter, to participate in the scoping meeting should contact Mr. Darud Akbar, Government and Community Relations Officer, at 312–681–2708 or *dakbar@transitchicago.com,* five days prior to the meeting.

Scoping materials describing the project purpose and need and the alternatives proposed for analysis will be available at the meetings and on the CTA Web site *http://www.transitchicago.com/RedEIS.* Paper copies of the scoping materials may also be obtained from Mr. Darud Akbar, Government and Community Relations Officer, at 312–681–2708 or *dakbar@transitchicago.com.* An interagency scoping meeting will be held on Thursday, September 24 at 10:30 a.m. at CTA Headquarters, in Conference Room 2C, 567 W. Lake Street, Chicago, IL 60661. Representatives of Native American tribal governments and of all federal, state, regional and local agencies that may have an interest in any aspect of the project will be invited to be participating or cooperating agencies, as appropriate.

ADDRESSES: Comments will be accepted at the public scoping meetings or they may be sent to Mr. Jeffrey Busby, General Manager, Strategic Planning, Chicago Transit Authority, P. O. Box 7602, Chicago, IL 60680–7602, or via e-mail at *RedExtension@transitchicago.com.*

FOR FURTHER INFORMATION CONTACT: Mr. David Werner, Community Planner, Federal Transit Administration, Region V, 200 West Adams Street, Suite 320, Chicago, IL 60606, phone 312–353–3879, e-mail *david.werner@dot.gov.*

SUPPLEMENTARY INFORMATION:

Scoping

The FTA and CTA invite all interested individuals and organizations, public agencies, and Native American Tribes to comment on the scope of the EIS, including the project's purpose and need, the alternatives to be studied, the impacts to be evaluated, and the evaluation methods to be used. Comments should address (1) alternatives that may better achieve the project's need and purposes at less cost or with fewer adverse impacts, and (2) any significant environmental impacts relating to the alternatives.

National Environmental Policy Act (NEPA) ''scoping'' (40 CFR 1501.7) has specific and fairly limited objectives, one of which is to identify the significant issues associated with alternatives that will be examined in detail in the document, while simultaneously limiting consideration and development of issues that are not truly significant. It is in the NEPA scoping process that potentially significant environmental impacts—those that give rise to the need to prepare an environmental impact statement—should be identified; impacts that are deemed not to be significant need not be developed extensively in the context of the impact statement, thereby keeping the statement focused on impacts of consequence. Transit projects may also generate environmental benefits; these should be highlighted as well—the impact statement process should draw attention to positive impacts, not just negative impacts.

Once the scope of the environmental study, including significant environmental issues to be addressed, is settled, an annotated outline of the document will be prepared and shared with interested agencies and the public. The outline serves at least three worthy purposes, including (1) Documenting the results of the scoping process; (2) contributing to the transparency of the process; and (3) providing a clear roadmap for concise development of the environmental document.

Purpose and Need for the Project

The purpose of the Red Line Extension project is to reduce travel times to jobs for far South Side and South Suburban residents and improve the performance of the existing Red Line 95th Street Station terminal. The project would also provide an opportunity to support economic development initiatives.

The need for the project is based on the following considerations: lack of park-and-ride, passenger drop-off, and poor pedestrian facilities limit access to the existing 95th Street terminal of the Red Line; customers accessing the existing terminal facility by bus experience measureable delays resulting from poor performance of surrounding arterial intersections, insufficient space for bus loading and unloading, and insufficient space for bus layovers; congested bus and passenger conditions at the existing terminal station and bus facility result in safety issues and diminish the attractiveness of transit as an alternative to other travel modes; roadway performance in the project area is adversely impacted by narrow arterial streets and frequent at-grade freight rail crossings; and, the project area population is highly transit-dependent, minority and low-income.

Project Location and Environmental Setting

The proposed heavy rail transit (HRT) project area lies about 11 miles south of the Chicago Central Area (commonly referred to as the ''Loop''). The limits of the project area are from 95th Street on the north to 130th Street on the south. The Calumet-Sag Channel/Little Calumet River extends along the southern edge of the project area and Lake Calumet is located to the east.

The project area includes parts of eight community areas in the far South of the City of Chicago. Community areas include Washington Heights, Morgan Park, Roseland, Pullman, West Pullman, South Deering, Hegewisch and Riverdale. The project area encompasses significant residential (primarily single family), industrial (existing and vacant), transportation, and commercial developments.

The locally preferred alternative (LPA) for the proposed Red Line Extension project was approved by the Chicago Transit Board for further study in the EIS on August 12, 2009. The LPA would extend the heavy rail transit line from the 95th Street Station south along the I–57 Expressway to the Union Pacific Railroad (UPRR) right-of-way near Eggleston Avenue. From that point, the line extends south from I–57 along the UPRR corridor to approximately 111th Street where it turns southeast along existing railroad and industrial right-of-way to terminate in the vicinity of 130th Street. The extension would add 5.3 new route miles of rapid transit to the existing Red Line, four additional stations at approximately 103rd, 111th, 115th, and 130th Streets with new park-and-ride and bus terminal facilities at each station.

Alternatives

The Red Line Extension Final Alternatives Analysis Report (2009) prepared by CTA identified three alternatives for further consideration in the EIS. These alternatives include: A No Build Alternative, Transportation System Management (TSM) Alternative, and the UPRR HRT Alternative (the LPA). Additionally, the Halsted Street HRT Alternative from the Red Line Extension Alternatives Analysis Screen 3 Report (2009) will be considered in the EIS.

No Build Alternative: The No Build Alternative is defined as the existing transportation system, plus any committed transportation improvements. Committed transportation improvements include projects that are already in the Chicago Metropolitan Agency for Planning (CMAP) financially constrained Transportation Improvement Program (TIP). The Red Line project area has five bridge reconstructions, and several road improvement projects included in the FY 2007–2012 TIP. These improvements are primarily on highway segments in the vicinity of the project area and generally do not lie adjacent to or intersect with the proposed TSM or HRT alternatives.

Bridge projects in the TIP include: Illinois 1 (Halsted Street) at the Little Calumet River; I–94 (Bishop Ford Expressway) at the Stony Island ramp and at Cottage Grove Road; I–57 at 103rd Street; and I–57 at Genoa Road. Road improvement projects include a variety of landscaping, safety fencing, and resurfacing projects, and coordination of signal timing on Stony Island Avenue from 95th Street north, and on 95th Street from Western Avenue east to Ewing Avenue. There is also a bicycle and pedestrian multi-use trail proposed to extend from the existing Centennial Trail in Lemont to the Burnham Greenway in Burnham.

Bus transit service under the No Build Alternative would be focused on the preservation of existing services and projects. No significant changes to bus service are anticipated in the project area. All elements of the No Build Alternative are included in each of the other alternatives.

Transportation System Management (TSM) Alternative: A TSM Alternative is proposed because it is required as part of the New Starts evaluative process; in this case, it does not meet the purposes of and need for the proposed project. The TSM Alternative is Bus Rapid Transit (BRT) that would operate between the 95th Street Station and 130th Street via East 95th Street, Michigan Avenue, East 127th Street, South Indiana Avenue, and East 130th Street. Proposed BRT service would operate in mixed traffic with traffic signal priority along 95th Street, Michigan Avenue, and 130th Street.

The TSM Alternative is 5.5 miles long and would include four intermediate stops at 103rd, 111th, 115th, and 130th Streets with park-and-ride facilities proposed at all of the new stops. The 95th Street terminal would be expanded to extend the existing bus bays along State and Lafayette Streets approximately 250-feet north to 94th Street to improve circulation and safety. The TSM alternative assumes that buses from the south would continue to serve the 95th Street Station.

UPRR Heavy Rail Transit (HRT) Alternative/Locally Preferred Alternative (LPA): The proposed LPA would operate between the existing Red Line 95th Street Station and 130th Street. The line would be on an elevated structure from the 95th Street as it heads south along the I–57 Expressway for nearly one-half mile until reaching the UPRR corridor in the vicinity of Eggleston Avenue. It would then turn south along the UPRR corridor to approximately 111th Street where it would turn southeast. East of South Prairie Avenue the alignment would cross over the Canadian National/Metra tracks near 119th Street where it would transition to an at-grade profile and then continue southeast along the former Michigan Central/Indiana Harbor Belt (IHB) railroad right-of-way to terminate in the vicinity of 130th Street.

The LPA is 5.3 miles long and would include three new intermediate stations at 103rd, 111th, and 115th Streets and a new terminal station at 130th Street with new park-and-ride and bus terminal facilities at each station. This alternative assumes that buses from the south would be re-routed to serve the new intermediate and terminal stations to speed passenger travel to downtown Chicago.

The new HRT tracks would be placed immediately adjacent to the UPRR right-of-way on either the west side (West Side Option) or the east side (East Side Option). Both options would require adjacent property acquisition to accommodate the CTA right-of-way and station facilities at 103rd, 111th, and 115th Streets. Based on a preliminary analysis of the conceptual alignment plans and Cook County parcel data, the West Side Option would require up to 112 property acquisitions and/or displacements and the East Side Option would require 138. In addition, the West Side Option could impact Fernwood Parkway between 99th Street and 103rd Streets which could trigger a Section 4(f) of the Department of Transportation Act evaluation in the EIS. The East Side Option could impact Wendell Smith Park adjacent to the I–57 Expressway which could also trigger a Section 4(f) evaluation in the EIS. Kensington Playground Park near 118th Street would not be impacted by either option.

There are two options for the 130th Street terminal station. The Red Line extension would continue south along the IHB right-of-way to either a south or west terminal station location along the north side of 130th Street, just west of the I–94 Bishop Ford Freeway.

Halsted Street HRT Alternative: The proposed Halsted Street HRT Alternative would be operated on an elevated structure between the existing Red Line 95th Street Station and the Halsted Street/Vermont Avenue intersection in the vicinity of 127th Street. The alignment would follow the median of I–57 Expressway until reaching Halsted Street. It would then turn south onto Halsted Street and continue in the median to Vermont Avenue.

The Halsted Street HRT Alternative is 5.0 miles long and would include three new intermediate stations at 103rd, 111th, 119th Streets and a new terminal station at Vermont Avenue with new park-and-ride and bus terminal facilities at the intermediate and terminal stations. This alternative assumes that buses from the south would be re-routed to serve the new intermediate and terminal stations to speed passenger travel to downtown Chicago.

Near the proposed station areas, there may be additional impacts to adjacent land owners if land acquisition would be required for station facilities such as bus turnarounds or parking facilities. This would be most applicable at the proposed terminal station at 127th/Vermont since several properties are located close to Halsted Street in this segment and there may be higher off-street facility needs.

Possible Effects

The purpose of this EIS process is to study, in a public setting, the effects of the proposed project and its alternatives on the quality of the human environment. Areas of investigation for transit projects generally include, but are not limited to: Land use, development potential, land acquisition and displacements, historic resources, visual and aesthetic qualities, air quality, noise and vibration, energy use, safety and security, and ecosystems, including threatened and endangered species; investigation may reveal that the proposed project will not affect or affect substantially many of those areas. Measures to avoid, minimize, or mitigate any significant adverse impacts will be identified.

FTA Procedures

The regulations implementing NEPA, as well as provisions of the Safe, Accountable, Flexible, Efficient Transportation Equity Act: A Legacy for Users (SAFETEA–LU), call for public involvement in the EIS process. Section 6002 of SAFETEA–LU requires that FTA and CTA do the following: (1) Extend an invitation to other Federal and non-Federal agencies and Native American tribes that may have an interest in the proposed project to become ‘‘participating agencies;’’ (2) provide an opportunity for involvement by participating agencies and the public to help define the purpose and need for a proposed project, as well as the range of alternatives for consideration in the EIS; and (3) establish a plan for coordinating public and agency participation in, and comment on, the environmental review process. An invitation to become a participating or cooperating agency, with scoping materials appended, will be extended to other Federal and non-Federal agencies and Native American tribes that may have an interest in the proposed project. It is possible that FTA and CTA will not be able to identify all Federal and non-Federal agencies and Native American tribes that may have such an interest. Any Federal or non-Federal agency or Native American tribe interested in the proposed project that does not receive an invitation to become a participating agency should notify at the earliest opportunity the Project Manager identified above under **ADDRESSES**.

A comprehensive public involvement program and a Coordination Plan for public and interagency involvement will be developed for the project and posted on CTA's Web site *http://www.transitchicago.com/RedEIS.* The public involvement program includes a full range of activities including maintaining the project Web page on the CTA Web site and outreach to local officials, community and civic groups, and the public. Specific activities or events for involvement will be detailed in the project's public participation plan.

The Paperwork Reduction Act seeks, in part, to minimize the cost to the taxpayer of the creation, collection, maintenance, use, dissemination, and disposition of information. Consistent with this goal and with principles of economy and efficiency in government, it is FTA policy to limit insofar as possible distribution of complete printed sets of environmental documents. Accordingly, unless a specific request for a complete printed set of environmental documents is received (preferably in advance of printing), FTA and its grantees will distribute only the executive summary of the environmental document together with a Compact Disc of the complete environmental document. A complete printed set of the environmental document is available for review at the grantee's offices and elsewhere; an electronic copy of the complete environmental document is also available on the grantee's Web page.

CTA may seek New Starts funding for the proposed project under 49 United States Code 5309 and will, therefore, be subject to New Starts regulations (49 Code of Federal Regulations (CFR) Part 611). The New Starts regulations also require the submission of certain project-justification information to support a request to initiate preliminary engineering. This information is normally developed in conjunction with the NEPA process. Pertinent New Starts evaluation criteria will be included in the EIS.

The EIS will be prepared in accordance with NEPA and its implementing regulations issued by the Council on Environmental Quality (40 CFR Parts 1500–1508) and with the FTA/Federal Highway Administration regulations ''Environmental Impact and Related Procedures'' (23 CFR Part 771).

Issued on: August 24, 2009.

Marisol R. Simon,

Regional Administrator, FTA Region V.

DEPARTMENT OF TRANSPORTATION

Federal Motor Carrier Safety Administration

Fiscal Year 2010 Safety Grants

AGENCY: Federal Motor Carrier Safety Administration (FMCSA), DOT.

ACTION: Notice; correction.

SUMMARY: FMCSA is correcting a notice that appeared in the **Federal Register** on August 12, 2009 (74 FR 40638), which informed the public of FMCSA's Fiscal Year (FY) 2010 safety grant opportunities and FMCSA's changes to its application and award processes for grant programs.

FOR FURTHER INFORMATION CONTACT: For further information regarding this notice please contact, Ms. Theresa Rowlett at 202.366.6406. Staff may be reached at FMCSA, 1200 New Jersey Avenue, SE., Washington, DC 20590. Office hours are from 9 a.m. to 5 p.m., EST, Monday through Friday, except Federal holidays.

SUPPLEMENTARY INFORMATION: For FMCSA's FY 2010 Grants notice published on August 12, 2009 (74 FR 40638), the following corrections are made:

On page 40638, in the **FOR FURTHER INFORMATION CONTACT** section, the contact for the Commercial Vehicle Information Systems and Networks Grants (CVISN) is corrected from ''CVISN Grants—Julie Lane, *julie.lane@dot.gov,* 202–385–2391'' to ''CVISN Grants—Quon Kwon, *quon.kwan@dot.gov,* 202–385–2389''.

On page 40638, in the *FY 2010 Safety Grants Program* section, the schedule for the New Entrant Safety Audit Grants and the Motor Carrier Safety Assistance Program (MCSAP) High Priority Grants is corrected from ''New Entrant Safety Audit Grants—September 1, 2009, MCSAP High Priority Grants—October 15, 2009'' to ''New Entrant Safety Audit Grants—October 15, 2009, MCSAP High Priority Grants—September 15, 2009.''

Issued on August 24, 2009.

William A. Quade,

Associate Administrator for Enforcement and Program Delivery.

DEPARTMENT OF TRANSPORTATION

Federal Aviation Administration

4th Meeting: RTCA Special Committee 221: Aircraft Secondary Barriers and Alternative Flight Deck Security Procedures

AGENCY: Federal Aviation Administration (FAA), DOT.

ACTION: Notice of RTCA Special Committee 221 meeting: Aircraft Secondary Barriers and Alternative Flight Deck Security Procedures.

SUMMARY: The FAA is issuing this notice to advise the public of a meeting of RTCA Special Committee 221: Aircraft Secondary Barriers and Alternative Flight Deck Security Procedures.

DATES: The meeting will be held September 15–16, 2009. September 15th from 12 a.m. to 5 p.m., September 16th from 9 a.m. to 5 p.m.

ADDRESSES: The meeting will be held at RTCA, Inc., MacIntosh—NBAA and Hilton—ATA Rooms, 1828 L Street, NW., Suite 805, Washington, DC 20036.

FOR FURTHER INFORMATION CONTACT: RTCA Secretariat, 1828 L Street, NW., Suite 805, Washington, DC 20036; telephone (202) 833–9339; fax (202) 833–9434; Web site *http://www.rtca.org.*

SUPPLEMENTARY INFORMATION: Pursuant to section 10(a)(2) of the Federal Advisory Committee Act (Pub. L. 92–463, 5 U.S.C., Appendix 2), notice is hereby given for a Special Committee 221: Aircraft Secondary Barriers and Alternative Flight Deck Security Procedures meeting. The agenda will include:

- Welcome/Introductions/Administrative Remarks;
- Approval of Summary of the Second Meeting held June 23–24, 2009, RTCA Paper No. 174–09/SC221–013;
- Leadership Comments;
- Review of Threat Work Group—Status Report;
- Review of Alternative Methods Work Group—Status Report;
- Review of Installed Physical Secondary Barrier (IPSB) Work Group—Status Report;
- Presentation/Discussion of SC–221 Schedule and Milestones;
- Discussion of Working Group reports: re-allocation of groups, capture learning points, discuss additional or follow-on goals;
- Approval and Tasking of Existing/Proposed Working Groups;
- Other Business—Including Proposed Agenda, Date and Place for Next Meeting.

Attendance is open to the interested public but limited to space availability. With the approval of the chairmen, members of the public may present oral statements at the meeting. Persons wishing to present statements or obtain information should contact the person listed in the **FOR FURTHER INFORMATION CONTACT** section. Members of the public may present a written statement to the committee at any time.

Issued in Washington, DC, on August 24, 2009.

Francisco Estrada C.,

RTCA Advisory Committee.

Re: Invitation to Participate in Environmental Review Process for the CTA Red Line Extension

Dear *[Agency Representative]*:

The Federal Transit Administration (FTA), in cooperation with the Chicago Transit Authority (CTA), is initiating the preparation of an Environmental Impact Statement for the proposed Red Line Extension project. The proposed project would extend the Red Line, a heavy rail transit line, 5.3 miles from its existing 95th Street Station to a new terminal station at 130th Street.

The purpose of the project, as currently defined, is to reduce travel times to jobs for Far South Side and South Suburban residents and improve the performance of the existing Red Line 95th Street Station terminal. The project would also provide an opportunity to support economic development initiatives. The enclosed scoping information packet provides more details including a preliminary project schedule.

An Alternatives Analysis has been completed for this project and the final report may be found at http://www.transitchicago.com/RedEIS. Through the Alternatives Analysis process and with input from the public and agencies, the project area and the range of alternatives have been refined and a locally preferred alternative has been selected. The project area and the alternatives identified in the Alternatives Analysis will be the subjects of the Draft EIS.

Section 6002 of the Safe, Accountable, Flexible, Efficient Transportation Equity Act: A Legacy for Users establishes an enhanced environmental review process for certain FTA projects, increasing the transparency of the process, as well as opportunities for participation. The requirements of Section 6002 apply to the project that is the subject of this letter. As part of the environmental review process for this project, the lead agencies must identify, as early as practicable, any other

Federal and non-Federal agencies that may have an interest in the project, and invite such agencies to become participating agencies in the environmental review process.[1]

Your agency has been identified preliminarily as one that may have an interest in this project, because of the surrounding land uses which include middle and low income residential neighborhoods, rail and surface transportation facilities, industrial brownfields, parks and natural areas, and the potential for impacts to the physical and human environment from construction and operation of the project; accordingly, you are being extended this invitation to become actively involved as a participating agency in the environmental review process for the project.

As a participating agency, you will be afforded the opportunity, together with the public, to be involved in defining the purpose of and need for the project, as well as in determining the range of alternatives to be considered for the project. These opportunities will build on the early participation opportunities that were provided during the Alternatives Analysis process. In addition, you will be asked to:

- Provide input on the impact assessment methodologies and level of detail in your agency's area of expertise;
- Participate in coordination meetings, conference calls, and joint field reviews, as appropriate; and
- Review and comment on sections of the pre-draft or pre-final environmental documents to communicate any concerns of your agency on the adequacy of the document, the alternatives considered, and the anticipated impacts and mitigation.

Your agency does not have to accept this invitation. If, however, you elect not to become a participating agency, you must decline this invitation in writing, indicating that your agency has no jurisdiction or authority with respect to the project, no expertise or information relevant to the project, and does not intend to submit comments on the project. The declination may be transmitted electronically to Mr. David Werner of our Region V Office at david.werner@dot.gov, please include the title of the official responding. In order to give your agency adequate opportunity to weigh the relevance of your participation in this environmental review process, written response to this invitation is not due until after the agency scoping. The interagency scoping meeting will be held on the following date and location:

- Thursday, September 24 at 10:30 a.m. at CTA Headquarters, in Conference Room 2C, 567 W. Lake Street, Chicago, IL 60661.

You or your delegate is invited to represent your agency at this meeting. Please note that building security requires meeting attendees to RSVP in advance. Your agency will be treated as participating agency unless your written response declining such designation as outlined above is transmitted to this office not later than September 30, 2009.

---

[1] Designation as a "participating agency" does not imply that the participating agency supports the proposed project or has any jurisdiction over, or special expertise concerning the proposed project or its potential impacts. A "participating agency" differs from a "cooperating agency," which is defined in regulations implementing the National Environmental Policy Act as "any Federal agency other than a lead agency which has jurisdiction by law or special expertise with respect to any environmental impact involved in a proposal (or a reasonable alternative) for legislation or other major Federal action significantly affecting the quality of the human environment." 40 C.F.R. § 1508.5.

We are providing a copy of the Federal Register Notice of Intent and scoping information materials with this letter that include a description of the project area and proposed alternatives. Additional information will be forthcoming during the scoping process. If you have questions regarding this invitation or to RSVP your attendance at the interagency scoping meeting, please contact Mr. Jeffrey Busby, General Manager, Strategic Planning, Chicago Transit Authority, PO Box 7602, Chicago, IL 60680-7602, via email at RedExtension@transitchicago.com, or phone at (312) 681-4240.

Sincerely,

Marisol R. Simon
Regional Administrator

Terry Morrison		IL State Police District Chicago
Chuck Abraham		IDOT / Manager of Program Support
Jill Zwick		State of Illinois / Secretary of State

PREPARED BY: Kim Cheever

ISSUE DATE: September 30, 2009

Meeting called to order at 10:35 am CDT.

Objective: Agency Scoping

Item No.	*Item Description*	*Responsibility*	*Due Date*
1.00	**Agency Participation Request** CTA presented a project overview and requested questions/comments from agencies in attendance. CTA requested written request from agencies interested in being a participating agency by October 2, 2009. Agencies do not have to be a participating agency to be involved, but it offers them a more active role in the process. Following the presentation, the meeting was opened up to questions and comments.		
1.01	CWC: Please note that the deadline to submit comments is October 27, 2009.		
1.02	CTA: The initial project concept was to route the new line within the railroad ROW, but railroad policy requires a 50' separation from the railroad to an adjacent transit line and there isn't sufficient room to accommodate the transit line within the existing ROW. The new line will need to be adjacent to the UPRR ROW on either the east or west side.		
2.00	**Land Acquisition** CDOE: How much acquisition would be involved? *CTA: We will study that in detail as part of the EIS; however, we did a preliminary analysis in the AA. The East Option would affect mostly residential properties, while the West Option would affect mostly commercial and vacant properties.*		
2.01	FTA: Does the UPRR alternative capital costs include property acquisition? *CTA: I believe that it does and takes into account the East Option that includes mostly residential properties.*		
3.00	**System Coordination** Metra: An important consideration is that there should be a joint station for Metra and CTA, as Metra is considering expansion of service and there are opportunities to connect to CTA service at 115th and 130th Streets. Intermodal station could be located at 130th for train to Indiana.		
4.00	**Project Costs** FTA: Does matrix include ROW costs? *CTA: The ROW costs are included but do not differentiate between the west or east side alternative.*		
5.00	**Bus Routes** Pace: Will bus access be evaluated at these stations and which bus routes would be affected? *CTA: Yes, bus access and impacts will be evaluated in the EIS.*		

Item No.	***Item Description***	***Responsibility***	*Due Date*
6.00	**Funding** Dept. of Planning: What if federal funds were not available? *CTA: Capital improvements in the CTA system are dependent on federal funds.*		
6.01	Dept. of Planning: If we don't get 2016 Olympic bid, will that impact likelihood of the project? *CTA: No, these projects are warranted without the Olympics and were not included in the Olympic bid package.*		
6.02	Detroit DOT: What is the percentage of New Starts funding that you are seeking? *CTA: Project sponsors are allowed to ask for up to 80%, but in the spirit of competitiveness the FTA desires a greater local commitment.*		
6.03	FTA: Having local and state funding in place as soon as possible is of critical importance in the New Starts process. *CTA: CTA is looking to get firm commitments in the next capital bill process.*		
7.00	**Impact of Grade Crossings** Pace: Do you look at impact of grade crossings and how buses would access the terminal? *CWC: Yes. If the project causes bus activity to be different, that's where we look at impact.*		
8.00	**Wetlands** CDOE: There are a lot of wetlands nearby, but route appears to avoid them. Excited this is on the table. Great for people trying to get to jobs. Station at 130th would be beneficial. There is a new environmental center under development at 38th and Torrence. LEED certification for that center would be helped by transit improvements. The agency is hearing that people are supportive of the project.		
9.00	**Contaminated Debris** CDOE: How do you handle contaminated debris during construction? *CTA: A pre-phase 1 analysis is done as part of the EIS to determine potential remediation methods and costs.*		
10.00	**Alternatives** CDOT: At which point will you select an East or West of right of way option? And the alternate terminal locations? How is that selection a part of this process? *CWC: The draft EIS will evaluate design options with the intent to fully inform decision makers, the FTA and stakeholders of the pros and cons of each alternative and each option.*		
11.00	**Preliminary Engineering** CDOT: When will preliminary engineering start? *CTA: Not until scoping is over. Entering into preliminary engineering requires Federal approval.* *CWC: Will need to do enough engineering to know what maximum impact could be.*		

Item No.	Item Description	Responsibility	Due Date
12.00	**Street Level Separation** IDOT: Are there any street level separations? *CTA: The entire line is elevated over street crossings. After the line crosses the ICCN tracks it comes down to grade to save money, along the Chicago's water reclamation property.*		
13.00	**Bus Operations and Coordination** Pace: What level of detail will be explored for bus needs to access this alternative? *CWC: The bus analysis will be performed in the EIS. The AA cost analysis looked at Pace bus restructuring at a high level, so it would help to get Pace feedback on this analysis.* *CTA: For costing, the AA process did make assumptions about PACE restructuring, but would be helpful to have PACE review those.* Pace: Would the bus analysis be done for both Halsted and the UPRR alignments? *CWC: Yes.*		
14.00	**Green Technology** CDOE: Do park & ride facilities include green technologies? *CTA: We will look at technological options as part of the project's mitigation methods.*		
15.00	**Public Input** Chicago Park District: What are some of the common concerns noted so far? *CTA: Noise and vibration from residents, and safety and security at stations. The public along this corridor are generally accepting of potential land acquisitions.*		
16.00	**MWRD Coordination** MWRD: Interested in a conceptual plan for terminal because it ends up on our property. *CTA: Have the conceptual profile sheets for review at this meeting.*		
17.00	**95th Street Station** Pace: Since congestion at the 95th Street station will be relieved by this project, how would you re-configure this facility? *CTA: We have not considered this yet, but it could be included within the EIS study.*		
18.00	**Bike Access** CDOE: Will there be bike access? City will accommodate bike access and consider adjacent trails. *CTA: We promote bike access and accommodate bike parking beyond fare gates. Interest in doing that.*		
19.00	**MWRD Odors** MWRD: Noted concern that there is an odor from the water treatment facility at 130th street. *CTA: EIS will need to gage magnitude of issue.*		

Item No.	*Item Description*	*Responsibility*	*Due Date*
20.00	**Safety and Security** IL State Police & Chicago Police: Raised potential concerns with access to expressway on-ramp during construction; need for coordination regarding ongoing patrolling of facility; was the cost of patrolling included? *CTA: These issues would be studied in more depth in the EIS.*		

Please notify the author of the minutes of any corrections and/or clarifications within five (5) business days.

cc: Attendees

Red Line Extension Project

Connecting 95th Street Station to 130th Street

**Come Participate in the
September 22 & 24, 2009
Scoping Meetings**

Customer Information: 1-888-YOUR-CTA (1-888-968-7282) • CTA TTY: 1-888-CTA-TTY1 (1-888-282-8891)
Transit Information: 836-7000 from any local area code RTA TTY: 312-836-4949

Red Line Extension

PROJECT OVERVIEW

The Chicago Transit Authority (CTA) is proposing to make transportation improvements by extending the Red Line from the 95th Street Station to the vicinity of 130th Street. The extension includes 5.3 new route miles of rapid transit from the existing Red Line, four additional stations – at approximately 103rd, 111th, 115th and 130th Streets – with new bus terminal and parking facilities at each station.

ENVIRONMENTAL PROCESS OVERVIEW

CTA and the Federal Transit Administration (FTA) have initiated the federal environmental process pursuant to the National Environmental Policy Act (NEPA) and are preparing an Environmental Impact Statement (EIS) for the project. The EIS will build upon the Alternatives Analysis (AA) process that occurred from 2006-2009 and culminated in the designation of a Locally Preferred Alternative by the Chicago Transit Board on August 12, 2009. The AA process analyzed an array of transportation alternatives and included an extensive public involvement process. The EIS will evaluate at least four alternatives: a No Build Alternative, a Transportation System Management (TSM) Alternative, the Locally Preferred Alternative that extends the Red Line to 130th Street and a rail alternative along Halsted Street. The EIS will describe the alternatives, the existing environmental setting, the potential impacts from construction and operation of each alternative and proposed mitigation measures to reduce or eliminate potential impacts.

SCOPING MEETINGS

You are invited to attend a public scoping meeting to learn more about the project and to provide feedback on the proposed alternatives, the purpose and need for the project, the proposed topics of evaluation and potential effects and mitigation measures to be included in the EIS.

WHAT IS SCOPING?

The process of determining the scope, focus and content of an EIS is known as "scoping." During the scoping process residents, as well as city, county, state and federal agencies have an opportunity to provide feedback and comments. The purpose of the scoping process is to:

- Identify public and agency concerns early in the environmental process
- Define the issues and alternatives that will be examined in the EIS
- Save time in the overall process and facilitate an efficient EIS preparation process.

SCOPING MEETING DATES AND LOCATIONS

Tuesday, September 22, 2009
Historic Pullman Visitor Center
6:00 p.m. to 8:00 p.m.
11141 S. Cottage Grove Avenue
Chicago, IL 60628
This location is accessible to people with disabilities and is served by CTA bus 111, Pace bus 353 , and the Metra Electric Main Line.

Thursday, September 24, 2009
Woodson Regional Chicago Public Library
6:00 p.m. to 8:00 p.m.
9525 S. Halsted Street
Chicago, IL 60628
This location is accessible to people with disabilities and is served by CTA bus 108, 112, 8A, 95W , Pace bus 352 and the Metra Electric Rock Island Line.

MEETING AGENDA AND FORMAT

Open House: 6:00 pm – 6:45 pm
Learn about the project and talk with project staff.
Presentation and Formal Public Comment:
6:45 pm – 8:00 pm
A brief presentation will be followed by an opportunity to enter formal comments into the public record.

SUBMIT COMMENTS

In addition to comments on the scope of the EIS received at the meeting, written scoping comments will be accepted until October 27, 2009 and may be submitted via mail, e-mail, fax or the project website with attention to: Jeffrey Busby, General Manager, Strategic Planning, Chicago Transit Authority, P.O. Box 7602, Chicago, IL 60680-7602.
Email: RedExtension@transitchicago.com
Website: www.transitchicago.com/RedEIS
Fax: (312)-681-4297

ADA AND LANGUAGE ACCOMMODATIONS

To receive an accessible format version of this notice, or if you require an interpreter, including sign language services, or other accommodations at this meeting, please contact Darud Akbar, Government & Community Relations Officer, five days prior to the meeting at (312) 681-2708 or dakbar@transitchicago.com. Information is also available at www.transitchicago.com/RedEIS

RTA (TTY): 312-836-4949

Extensión de la Línea Roja

RESUMEN GENERAL DEL PROYECTO

La Chicago Transit Authority (CTA) se propone hacer mejoras de transporte al extender la Línea Roja desde la estación de la 95th Street a las inmediaciones de la 130th Street. La extensión incluye una ruta nueva de 5.3 millas de tránsito rápido de la Línea Roja ya existente, cuatro estaciones más – ubicadas aproximadamente en las 103rd, 111th, 115th, y 130th Streets – con una nueva terminal de autobuses e instalaciones de estacionamiento en cada estación.

RESUMEN GENERAL DEL PROCESO MEDIOAMBIENTAL

La CTA y la Administración Federal de Tránsito (conocida en inglés por sus siglas “FTA”) han iniciado un proceso federal medioambiental, de acuerdo a la Ley sobre la Política Nacional Medioambiental (conocida en inglés por sus siglas “NEPA”) y están en vías de elaborar una Declaración sobre el Efecto Medioambiental (conocida en inglés por sus siglas “EIS”) para el proyecto. La EIS se elaborará en base al proceso de Análisis de Alternativas (conocido en inglés por sus siglas “AA”) que tomó lugar desde 2006 a 2009 y culminó en una Alternativa de Preferencia Local que adoptó la Junta Directiva de Tránsito de Chicago el 12 de agosto de 2009. El Proceso de AA analizó una serie de alternativas de transporte e incluyó un amplio proceso de involucramiento al público. La EIS evaluará por lo menos cuatro alternativas: una Alternativa sin obras de construcción; una Alternativa de Administración del Sistema de Transporte (conocida en inglés por sus siglas “TSM”), una Alternativa de Preferencia Local que extiende la Línea Roja a la 130th Street, y una alternativa ferroviaria por la Halsted Street. La EIS detallará la alternativa, el contexto medioambiental existente, los efectos posibles de la construcción y la puesta en marcha de cada alternativa, y las medidas atenuadoras propuestas para disminuir o eliminar los efectos negativos posibles.

REUNIÓN PARA INVOLUCRAR AL PÚBLICO

Usted queda invitado a asistir una reunión para involucrar al público, con el fin de informarse en más detalle sobre el proyecto y para expresar sus opiniones sobre las alternativas propuestas, el propósito y la necesidad del proyecto, los temas propuestos de evaluación, los efectos negativos posibles, y las medidas atenuadoras que habrá que incluir en la EIS.

¿QUÉ ES EL INVOLUCRAMIENTO AL PÚBLICO?

Se conoce el proceso de determinar el alcance, el enfoque, y el contenido de una EIS como el “involucramiento al público”. Durante este proceso de involucramiento comunitario, los residentes, así como las agencias municipales, condales, estatales, y federales, tendrán la oportunidad de expresar sus opiniones y hacer comentarios. Este proceso de involucramiento se dedica a:

- Identificar las cuestiones de preocupación del público y las agencias gubernamentales por adelantado durante el proceso de evaluación medioambiental.
- Definir las cuestiones y las alternativas que serán estudiadas en la EIS.
- Ahorrar tiempo en el proceso general y agilizar la eficacia del proceso de elaborar la EIS.

INVOLUCRAMIENTO AL PÚBLICO: Fechas y Localidades

martes, 22 de septiembre de 2009
Historic Pullman Visitor Center
6:00 p.m. to 8:00 p.m.
11141 S. Cottage Grove Avenue
Chicago, IL 60628
Esta localidad tiene acceso para las personas con incapacidades, y el autobús 111 de la CTA, el autobús 353 de Pace, y la Línea Eléctrica Principal de Metra brindan servicio de transporte hasta allá.

jueves, 24 de septiembre de 2009
Woodson Regional Chicago Public Library
6:00 p.m. to 8:00 p.m.
9525 S. Halsted Street
Chicago, IL 60628
Esta localidad tiene acceso para las personas con incapacidades, y el autobús 108, 112, 8A, y 95W de la CTA, el autobús 352, de Pace, y la Línea Eléctrica de Rock Island de Metra brindan servicio de transporte hasta allá.

ORDEN DEL DÍA Y FORMATO

Presentación al público: 6:00 pm – 6:45 pm
Informarse sobre el proyecto y hablar con el personal del proyecto.
Presentación y comentarios formales del público: 6:45 pm – 8:00 pm
Después de una breve presentación, habrá una oportunidad para hacer comentarios que constarán formalmente en el acta pública.

ENTREGA DE COMENTARIOS

Además de los comentarios sobre el alcance de la EIS que se entregarán en la reunión, se aceptarán comentarios por escrito proporcionados por el público hasta el 27 de octubre de 2009, los cuales pueden entregarse por correo postal, correo electrónica, por facsímile, o al sitio de web del proyecto, a la atención de Jeffrey Busby, General Manager, Strategic Planning, Chicago Transit Authority, P.O. Box 7602, Chicago, IL 60680-7602.
Correo electrónico: RedExtension@transitchicago.com
Sitio de web: www.transitchicago.com/RedEIS
Facsímile: (312)-681-4297

ADAPTACIONES PARA LAS PERSONAS CON INCAPACIDADES Y POR MOTIVOS DE IDIOMA

Para recibir una versión de formato asequible de esta notificación, o en caso de que usted tenga necesidad de un intérprete, incluso el servicio de traducción por señas, u otras adaptaciones para poder participar en esta reunión, por favor comuníquese con Darud Akbar, Government & Community Relations Officer, con cinco días de antelación de esta reunión, al (312) 681-2708, o al dakbar@transitchicago.com. La información también está disponible en el sitio de web www.transitchicago.com/RedEIS.

Red Line Extension

Connecting 95th Street Station to 130th Street

cta

ATTEND A PUBLIC SCOPING MEETING

Tuesday, September 22, 2009
6:00 to 8:00 p.m.
Historic Pullman Visitor Center
11141 S. Cottage Grove Avenue, Chicago

Thursday, September 24, 2009
6:00 to 8:00 p.m.
Woodson Regional Chicago Public Library
9525 S. Halsted Street, Chicago

Information presented will be the same at both meetings. These facilities are accessible to persons with disabilities.

The Chicago Transit Authority (CTA) is proposing to make transportation improvements by extending the Red Line from the 95th Street Station to the vicinity of 130th Street.

We want to hear from you!

Attend one of the public scoping meetings to learn more about the project and provide feedback on the proposed alternatives, the purpose and need for the project and the environmental and community impacts to be evaluated. The input will help define the environmental studies to be considered in the Draft Environmental Impact Statement (EIS) scheduled for public review in late 2010.

Submit a Comment by October 27, 2009

In addition to comments received at the meeting, written comments will be accepted until October 27, 2009. Comments may be submitted by mail, e-mail or fax, with attention to:

Red Line Extension

PROJECT OVERVIEW

The Chicago Transit Authority (CTA) is proposing to make transportation improvements by extending the Red Line from the 95th Street Station to the vicinity of 130th Street. The extension includes 5.3 new route miles of rapid transit from the existing Red Line, four additional stations – at approximately 103rd, 111th, 115th and 130th Streets – with new bus terminal and parking facilities at each station.

ENVIRONMENTAL PROCESS OVERVIEW

CTA and the Federal Transit Administration (FTA) have initiated the federal environmental process pursuant to the National Environmental Policy Act (NEPA) and are preparing an Environmental Impact Statement (EIS) for the project. The EIS will build upon the Alternatives Analysis (AA) process that occurred from 2006-2009 and culminated in the designation of a Locally Preferred Alternative by the Chicago Transit Board on August 12, 2009. The AA process analyzed an array of transportation alternatives and included an extensive public involvement process. The EIS will evaluate at least four alternatives: a No Build Alternative, a Transportation System Management (TSM) Alternative, the Locally Preferred Alternative that extends the Red Line to 130th Street and a rail alternative along Halsted Street. The EIS will describe the alternatives, the existing environmental setting, the potential impacts from construction and operation of each alternative and proposed mitigation measures to reduce or eliminate potential impacts.

SCOPING MEETINGS

You are invited to attend a public scoping meeting to learn more about the project and to provide feedback on the proposed alternatives, the purpose and need for the project, the proposed topics of evaluation and potential effects and mitigation measures to be included in the EIS.

WHAT IS SCOPING?

The process of determining the scope, focus and content of an EIS is known as "scoping." During the scoping process residents, as well as city, county, state and federal agencies have an opportunity to provide feedback and comments. The purpose of the scoping process is to:

- Identify public and agency concerns early in the environmental process
- Define the issues and alternatives that will be examined in the EIS
- Save time in the overall process and facilitate an efficient EIS preparation process.

SCOPING MEETING DATES AND LOCATIONS

Tuesday, September 22, 2009
Historic Pullman Visitor Center
6:00 p.m. to 8:00 p.m.
11141 S. Cottage Grove Avenue
Chicago, IL 60628
This location is accessible to people with disabilities and is served by CTA bus 111, Pace bus 353 , and the Metra Electric Main Line.

Thursday, September 24, 2009
Woodson Regional Chicago Public Library
6:00 p.m. to 8:00 p.m.
9525 S. Halsted Street
Chicago, IL 60628
This location is accessible to people with disabilities and is served by CTA bus 108, 112, 8A, 9, 95W and Pace bus 352.

MEETING AGENDA AND FORMAT

Open House: 6:00 pm – 6:45 pm
Learn about the project and talk with project staff.
Presentation and Formal Public Comment:
6:45 pm – 8:00 pm
A brief presentation will be followed by an opportunity to enter formal comments into the public record.

SUBMIT COMMENTS

In addition to comments on the scope of the EIS received at the meeting, written scoping comments will be accepted until October 27, 2009 and may be submitted via mail, e-mail, fax or the project website with attention to: Jeffrey Busby, General Manager, Strategic Planning, Chicago Transit Authority, P.O. Box 7602, Chicago, IL 60680-7602.

Chicago Transit Authority
Orange Line Extension NEPA Scoping Meeting Notice

The Chicago Transit Authority (CTA) is proposing to make trans-
portation improvements by extending the Orange Line from Mid-
way Station at the Midway International Airport south along the
Belt Railway Company right-of-way from 59th to Marquette Road,
crossing the Belt Railway Company Clearing Yard and ending on
Cicero Avenue. The extension includes 2.3 new route miles of
rapid transit from the existing Orange Line and one additional
station at approximately 7600 S. Cicero Avenue with new bus
erminal and parking facilities.

CTA and the Federal Transit Administration (FTA) have initiated
he federal environmental process pursuant to the National En-
vironmental Policy Act (NEPA) and are preparing an Environmen-
al Impact Statement (EIS) for the project. The EIS will build
upon the Alternatives Analysis (AA) process that occurred from
2006 - 2009 and culminated in the designation of a Locally Pre-
erred Alternative by the Chicago Transit Board on August 12,
2009. The AA process analyzed an array of transportation alter-
natives and included an extensive public involvement process.
The EIS will evaluate at least three alternatives: a No Build Al-
ernative, a Transportation System Management (TSM) Alterna-
ive and the Locally Preferred Alternative that extends the Or-
ange Line to Cicero Avenue near 76th Street. The EIS will de-
scribe the alternatives, the existing environmental setting, the
potential impacts from construction and operation of each alter-
native and proposed mitigation measures to reduce or elimi-
nate potential impacts.

You are invited to attend a public scoping meeting to learn
more about the project and to provide feedback on the pro-
posed alternatives, the purpose and need for the project, the
proposed topics of evaluation and potential effects and mitiga-
ion measures to be considered in the EIS.

Monday, September 21, 2009; 6:00 p.m. to 8:00 p.m.; at the
Hancock College Preparatory High School, 4034 W. 56th Street,
Chicago, IL 60629
his location is accessible to people with disabilities and is
erved by CTA Bus Routes 53A and 55.

n addition to comments received at the meeting, written com-
ments will be accepted until October 27, 2009 and may be sub-
mitted via mail, e-mail or fax to: Jeffrey Busby, General Manag-
r, Strategic Planning, Chicago Transit Authority, P.O. Box 7602,

Chicago Transit Authority
Yellow Line Extension NEPA Scoping Meeting Notice

The Chicago Transit Authority (CTA) is proposing to make transportation improvements by extending the Yellow Line from Dempster Station to Old Orchard Road. The Yellow Line Extension includes 1.6 new route miles of rapid transit from the existing Yellow Line, reconfiguration of the existing Dempster Station and one additional station at Old Orchard Road with new bus access and parking facilities.

CTA and the Federal Transit Administration (FTA) have initiated the federal environmental process pursuant to the National Environmental Policy Act (NEPA) and are preparing an Environmental Impact Statement (EIS) for the project. The EIS will build upon the Alternatives Analysis (AA) process that occurred from 2006-2009 and culminated in the designation of a Locally Preferred Alternative by the Chicago Transit Board on August 12, 2009. The AA process analyzed an array of transportation alternatives and included an extensive public involvement process. The EIS will evaluate at least three alternatives; a No Build Alternative, a Transportation System Management (TSM) Alternative and the Locally Preferred Alternative that extends the Yellow Line to Old Orchard Road. The EIS will describe the alternatives, the existing environmental setting, the potential impacts from construction and operation of each alternative and proposed mitigation measures to reduce or eliminate potential impacts.

You are invited to attend a public scoping meeting to learn more about the project and to provide feedback on the proposed alternatives, the purpose and need for the project, the proposed topics of evaluation and potential effects and mitigation measures to be considered in the EIS.

Wednesday, September 23, 2009; 6:00 p.m. to 8:00 p.m.; at the Oakton Community Center, 4701 Oakton Street, Skokie, IL 60076
This location is accessible to people with disabilities and is served by CTA bus 97.

In addition to comments received at the meeting, written comments will be accepted until October 27, 2009 and may be submitted via mail, e-mail or fax to: Jeffrey Busby, General Manager, Strategic Planning, Chicago Transit Authority, P.O. Box 7602, Chicago, IL 60680-7602.

CTA to Host Public Meeting for Proposed Orange Line Extension

The Chicago Transit Authority is hosting a public meeting to receive input on the proposed Orange Line Extension project. Attendees will have an opportunity to provide comments on the proposed alternatives, the purpose and need for the project, the potential effects and mitigation measures to be considered in the Environmental Impact Study (EIS).

The meeting is scheduled for:

Monday, September 21
6:00 p.m. - 8:00 p.m.
Hancock College Preparatory High School*
4034 W. 56th St., Chicago, IL
(*facility is accessible to people with disabilities)

Written comments also will be accepted until October 27. Scoping comments may be submitted via mail, email or fax to the attention of:

Jeffery Busby, General Manager, Strategic Planning
Chicago Transit Authority
PO Box 7602
Chicago IL 60680-7602
OrangeExtension@transitchicago.com
Fax 312-681-4297

Attendees who require an interpreter, including sign language services, or other accommodations at the meeting should contact Darud Akbar, Government and Community Relations Officer, at 312-681-2708.

CTA and the Federal Transit Administration (FTA) have initiated the federal environmental process pursuant to the National Environmental Policy Act (NEPA) and are preparing an EIS for the project. The EIS will evaluate at least three alternatives: a No Build Alternative, a Transportation System Management (TSM) Alternative and the Locally Preferred Alternative (LPA) adopted by the Chicago Transit Board that extends the Orange Line to Cicero Avenue near 76th Street.

The EIS will build upon the Alternatives Analysis process that led to the adoption of a Locally Preferred Alternative.

The Federal Transit Administration's New Starts program requires transit project proposals to proceed through a process of planning, design and construction. The FTA process consists of five formal steps: Alternatives Analysis (AA), Environmental Impact Statement, Preliminary Engineering, Final Design and Construction.

fore Griffin passed away. "He did a great job for Samford, and all the coaches loved him. That was no surprise to me."

Griffin received one of Samford's Practice Hard Work Awards following his junior been established in Griffin's name to benefit the Marist basketball program. Donations may be sent to Coach Gene Nolan, c/o Marist High School, 4200 W. 115th St., Chicago, IL 60655.

"Marc was in the right place at the right time," said Clemens. "But that play showed that you just have to put the ball in the right spot to score."

The Caravan dominated minute left, Enrique Voltaire was unable to get control on a breakaway, and his shot missed the left post.

It didn't take long for Andrew (2-3-1) to end the game in the extra session.

Jacobs got one past talented Caravan goalie Edson Zagal, portunities in front of you and don't take advantage. The ball needs to get through 10 guys before it even gets to him."

An example of Mt. Carmel's domination of the game, the Caravan had six corner kicks to just one for Andrew and had five more shots on goal.

Softball

(Continued from page 17)

Wabash Tap, which features 10 local players among the 15-player roster, captured the title on Sept. 9.

"We have been playing together for a couple of years," said Player/Coach Matt Hilliard, a Sutherland Elementary School and St. Ignatius College Prep graduate. "It's great that a group of friends who grew up together, but now live all over the city, can still get together to play every week. We plan on continuing to dominate the Wednesday night league until we are too old and feeble to swing a bat."

Domination was the perfect word to describe the team. It went 9-0 in the regular season, scoring 108 runs and allowing just 38.

Other team members are Conor Ryan, Joe Wilson, Kerry Brackin, Liam McManus, Catherine Corr, Brendan Sheils, Bob Kriz, Pete Steadman, Kathleen Griffin, Samantha Kyme, Jen Sheridan, Colleen McNamara, Meeghan Holly and Lydia Maloney.

Winning the financial game

by Michael G. Shinn

"Winning is not a sometime thing. It's an all time thing. You don't win once in a while, you don't do things right once in a while, you do them right all the time. Winning is a habit. Unfortunately, so is losing," stated

Winning financially and achieving financial goals is not a sometime thing, it's an all time thing. The seven steps to setting and achieving financial goals are not secrets. We do it all the time on our jobs, when we set sales or production goals, cost reductions or specific project achievements. The trick is to apply the same techniques to your finances, with the same rigor and personal management. It starts with a winning attitude.

Steps to setting financial goals:

Step 1- Sit down with a clean sheet of paper and brainstorm the question, "What do I really want out of life?" Write down every possible financial goal that comes to mind – a house, early retirement, debt payoff, dren's education, new car, ove vacation, etc. Dream and write all down.

Step 2- Discuss the list with family or people who are signi in your life. With their input, ex and modify the list. In working clients, I find that many times have not discussed their fan financial goals and agreed on th ority. This lack of communic about finances can lead to se family conflicts.

Step 3- Now go over your second time. This time, refine prioritize the list, adding an ele of realism to it. Write down the that are most important on a she paper called "Key Financial Go Cross off the items you really want or need. Move anything might have mixed emotions to a arate sheet called "Future Go After you have achieved som your key goals, you may wa include some items from this lis

Step 4- Expand each of you goals, estimating the cost (in to dollars) and when you will ac the goal. It is very important tha are specific in each of these area

Step 5- Separate your Key into short-term, intermediate long-term objectives. Short- goals can be achieved in less tha year and might include; estab ment of an emergency fund, year's vacation, or minor improvements. Intermediate go one to five years might include; ing off credit card debt, saving house down payment or ma major home improvements. L term goals of more than five might include; college fun retirement or a vacation home chase.

Step 6- Develop a plan for ac ing each Key Goal, breaking large goals into their main elem Using the college fund exa Research public college costs; a 529 Saving Plan account; I $328 per month using auto withdrawal from my chec account; Research investments could provide a higher return.

Step 7- Monitor your progres reviewing your financial goa least annually and revising your as necessary.

cutting a fool when the President spoke at the joint session of Congress. It was totally disrespectful of this dunder head to heckle the President as he gave his speech. No one, especially Black U. S. legislators ever did such a thing to President George Dubya Bush, although it was pretty darn clear he did not always tell the truth and coupled with the lyingest Vice President in the world in Dick Cheney, a heckle or two would have been in order for this pair. They lied about WMD (Weapons of Mass Destruction) as the reason to invade Iraq, lied about exposing a CIA Agent to harm, you name it, yet our Congresspersons were restrained and respectful to the office of President. But just like everything else once we get to goals such as being President of the United States, the rules change. Money I hear has been pouring in to the Congressman to further his campaign by racists everywhere. And that's exactly who (racists) poured into Washington over the weekend to demonstrate and talk about the President.

HATE SIGNS REMINISCENT OF KKK

If Ima had not been told differently she would have headed for the hills last week when the hate mongers of the world spilled over into Washington, D. C. You see Ima remembers the KKK riding

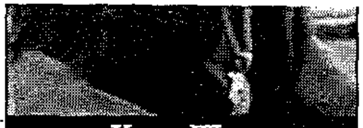
ulate where this all will end up. It's scary. But it is also clear that the racists are now synonymous with the Republican Party.

OUT OF CONTROL

If it ain't enough and the real reason Ima consulted the trusty Almanac about the moon is that one of our revered sports figures and a popular music artist started acting crazy. Ima was shocked to see Serena Williams at as she did at the U.S. Open Tennis Match. Ima has been known to know how to weave the f word into sentences at the appropriate places, was speechless when one such as Serena, who has been subjected to all kinds of challenges in fighting her way to the top, let go on a line judge at the tennis competition.

Serena Williams

Now she has apologized but it



Kanye West

that his last "buffoonery" piece pulled in $24 million dollars this past weekend for "I Can Do Bad All By Myself." So Spike, et al

now suffering from.

ATTEND A PUBLIC SCOPING MEETING

Tuesday, September 22, 2009
6:00 to 8:00 p.m.
Historic Pullman Visitor Center
11141 S. Cottage Grove Avenue, Chicago

Thursday, September 24, 2009
6:00 to 8:00 p.m.
Woodson Regional Chicago Public Library
9525 S. Halsted Street, Chicago

Information presented will be the same at both meetings. These facilities are accessible to persons with disabilities.

The Chicago Transit Authority (CTA) is proposing to make transportation improvements by extending the Red Line from the 95th Street Station to the vicinity of 130th Street.

We want to hear from you!

Attend one of the public scoping meetings to learn more about the project and provide feedback on the proposed alternatives, the purpose and need for the project and the environmental and community impacts to be evaluated. The input will help define the environmental studies to be considered in the Draft Environmental Impact Statement (EIS) scheduled for public review in late 2010.

Submit a Comment by October 27, 2009
In addition to comments received at the meeting, written comments will be accepted until October 27, 2009.
Comments may be submitted by mail, e-mail or fax, with attention to:

Caribe América Latina

Interceptan en alta mar a 35 indocumentados

Iban en un velero hacia Puerto Rico. Había un chino

EFE
SANTO DOMINGO

La Marina de Guerra dominicana interceptó ayer en alta mar a treinta y cinco personas, entre ellas un nacional chino, que se dirigían clandestinamente en un velero a Puerto Rico, informó la Armada local.

REPÚBLICA DOMINICANA

El grupo viajaba en el velero "Mi niña" de matrícula dominicana, que fue detenido a seis millas de Cap Cana, en la provincia La Altagracia, en el extremo oriental del país.

Los indocumentados, que se encuentran en buen estado de salud, serán traslados a la sede de la Marina de Guerra, en Santo Domingo, para ser interrogados, dijo a Efe un portavoz de la institución.

*La Marina de Guerra apresó la semana pa*sada a 18 personas, entre ellas dos menores de edad y dos ceilandeses, que intentaban viajar a Miami (EE.UU.) también en un velero.

La Procuraduría General y la Armada local anunciaron el mes pasado que coordinan acciones para perseguir a los traficantes de personas, muchas de las cuales pierden la vida cada año en las aguas del Mar Caribe en ruta hacia la vecina isla de Puerto Rico.

Los trabajos son coordinados en cumplimiento a la Ley-137-03 que sanciona en el país el delito del tráfico ilícito de inmigrantes y trata de personas, implementando así una política de combate al crimen organizado con jurisdicción en todo el país.

Cada año miles de dominicanos tratan de llegar a Puerto Rico para sortear la precaria situación económica en la que viven.

En julio pasado, entre 20 y 25 dominicanos desaparecieron en ruta a Puerto Rico tras zarpar el día 11 de la playa de Gaspar Hernández, en la provincia Espaillat, norte del país.

Connecting 95th Street Station to 130th Street

Environmental Impact Statement Scoping Information

September 2009

Department of Transportation
United States of America

cta

INTRODUCTION

The Chicago Transit Authority (CTA) is proposing to make transportation improvements by extending the Red Line from the 95th Street station to 130th Street. CTA and the Federal Transit Administration (FTA) will be preparing an Environmental Impact Statement (EIS) that will evaluate the environmental impacts of constructing and operating the extension.

PURPOSE OF THE EIS AND SCOPING PROCESSS

In accordance with the National Environmental Policy Act (NEPA), CTA and FTA have initiated the environmental review process for the Red Line Extension. An EIS will be prepared to identify impacts related to project construction and operation. As part of the initial phase of the environmental process, public scoping meetings will be hosted to receive public comments on the alternatives and issues that should be examined as part of the environmental analysis. These public meetings are also requirements of the Safe, Accountable, Flexible, Efficient Transportation Equity Act: A Legacy for Users (SAFETEA-LU), which requires project proponents to provide opportunities for public participation in transportation decision-making.

The process of determining the scope, focus and content of an EIS is known as "scoping." Scoping meetings are a useful opportunity to obtain information from the public and governmental agencies. In particular, the scoping process asks agencies and interested parties to provide input on the proposed alternatives, the purpose and need for the project, the proposed topics of evaluation, and potential impacts and mitigation measures to be considered.

ENVIRONMENTAL ANALYSIS

Environmental issues to be examined in the EIS include:

- Cultural resources
- Wildlife and ecosystems
- Energy use
- Land acquisition, displacements and relocations
- Land use
- Natural resources (including air quality and water resources)
- Neighborhood compatibility and environmental justice
- Parklands/ recreational facilities
- Safety and security
- Transportation
- Visual and aesthetic impacts
- Noise and vibration
- Zoning and economic development and secondary development

PROJECT OVERVIEW

In 2006, the Chicago Transit Authority (CTA) and the Federal Transit Administration (FTA) began the Alternatives Analysis process for the proposed Red Line Extension. As part of the three step screening process, CTA has held six public meetings over the past three years in order to gather input from the public regarding alternative options. CTA evaluated nine alternatives and has adopted the Union Pacific Railroad (UPRR) Heavy Rail Transit (HRT) Alternative as the Locally Preferred Alternative(LPA) for further study in the EIS. The proposed Red Line Extension will be further refined during the conceptual design phase of the project and is being carried forward for additional study in the EIS.

PROJECT ALTERNATIVES TO BE EVALUATED IN THE EIS

The EIS will include an evaluation of the following alternatives:

No Build Alternative

The No Build Alternative is defined as the existing transportation system, plus any committed transportation improvements that are already in the Chicago Metropolitan Agency for Planning (CMAP) FY 2007 – 2012 Transportation Improvement Program (TIP). TIP projects within the project area consist of five bridge reconstructions and several road improvement projects that include landscaping, fencing, resurfacing, coordination of signal timing, and a bicycle/ pedestrian multi-use trail. All elements of the No Build Alternative are included in each of the other alternatives.

Summary:

- Existing transportation system
- Plus committed transportation improvements: bridge and road improvement projects
- Bus transit service focused on the preservation of existing services and projects

Transportation System Management (TSM) Alternative

The proposed TSM Alternative is a Bus Rapid Transit (BRT) alternative that operates between the 95th Street Station and 130th Street via East 95th Street, Michigan Avenue, East 127th Street, South Indiana Avenue, and East 130th Street.

Summary:

- No Build Alternative, plus:
- Bus Rapid Transit (BRT) that operates between the 95th Street Station and 130th Street
- 5.5 miles long with four intermediate stops at 103rd, 111th, 115th and 130th Streets
- Park-and-ride facilities proposed at all new stops

- Operates in mixed traffic with traffic signal priority along 95th Street, Michigan Avenue, and 130th Street
- 95th Street terminal expanded to extend the existing bus bays along State and Lafayette Streets approximately 250-feet north to 94th Street to improve circulation and safety
- Existing buses from the south continue to serve the 95th Street station

Locally Preferred Alternative (LPA): Union Pacific Railroad (UPRR) Heavy Rail Transit (HRT) Alternative

The proposed LPA would extend the heavy rail transit line from the existing Red Line 95th Street Station to 130th Street.

Summary:

- No Build Alternative, plus:
- Heavy rail transit line extension from 95th Street Station to 130th Street
- 5.3 mile extension with three new intermediate stops at 103rd, 111th and 115th Streets and a new terminal station at 130th Street
- New park-and-ride and bus terminal facilities at each station
- Operates on an elevated structure from 95th Street as it heads south along the I-57 Expressway for nearly one-half mile until reaching the UPRR corridor in the vicinity of Eggleston Avenue. It would then turn south along the UPRR corridor to approximately 111th Street where it would turn southeast. East of South Prairie Avenue the alignment crosses over the CN/Metra tracks near 119th Street where it transitions to an at-grade profile and then continues southeast along the former Michigan Central/Indiana Harbor Belt (IHB) railroad right-of-way to terminate in the vicinity of130th Street.
- Buses from the south would be rerouted to serve the new intermediate and terminal stations to speed passenger travel to downtown Chicago
- Two alignment options will be studied in the EIS: Tracks could be placed immediately adjacent to the UPRR right-of-way on either the west side (West Side Option) or the east side (East Side Option)
- Two options for the 130th Street terminal station will be studied in the EIS: The line would continue south along the IHB right-of-way to either a south or west terminal station location along the north side of 130th Street, just west of the I-94 Bishop Ford Freeway

Halsted Street Heavy Rail Transit (HRT) Alternative

The proposed Halsted Street HRT Alternative would extend the rail transit line from the existing Red Line 95th Street Terminal station to terminate at the Halsted Street/Vermont Avenue intersection in the vicinity of 127th Street.

Summary:

- No Build Alternative, plus:
- Heavy rail transit line extension from 95th Street Station to Halsted Street/Vermont Avenue intersection
- 5.0 mile extension with three new intermediate stops at 103rd, 111th, 119th Streets and a new terminal station at Vermont Avenue
- New park-and-ride facilities at intermediate and terminal stations
- Operates on an elevated structure between the existing Red Line 95th Street Station and the Halsted Street/Vermont Avenue intersection in the vicinity of 127th Street. The alignment would follow the median of I-57 Expressway until reaching Halsted Street. It would then turn south onto Halsted Street and continue in the median to Vermont Avenue
- Buses from the south would be rerouted to serve the new intermediate and terminal stations

Other alternatives may also be identified in the scoping process.

PROJECT PURPOSE AND NEED

The purpose of the Red Line Extension project is to reduce travel times to jobs for Far South Side and South Suburban residents and improve the performance of the existing Red Line 95th Street Station terminal. The project would also provide an opportunity to support economic development initiatives.

The need for the project is based on the following considerations:

- Lack of park-and-ride, passenger drop off and poor pedestrian facilities limit access to the existing 95th Street terminal of the Red Line
- Customers accessing the existing terminal facility by bus experience measureable delays resulting from poor performance of surrounding arterial intersections, xinsufficient space for bus loading and unloading, and insufficient space for bus layovers
- Congested bus and passenger conditions at the existing terminal station and bus facility result in safety issues and diminish the attractiveness of transit as an alternative to other travel modes
- Roadway performance in the study area is adversely impacted by narrow arterial streets and frequent at-grade freight rail crossings
- Study area population is highly transit dependent, minority, and low-income.

PUBLIC PARTICIPATION

Throughout the EIS process, CTA will offer a number of opportunities for you to get involved in the Red Line Extension project. Whether you want to take an active role in shaping this project or just want to stay informed, CTA looks forward to your participation in the months ahead. To ensure that the issues most important to residents, public agencies, and other involved parties are addressed in this review, CTA is hosting two scoping meetings to collect public input. The input gathered from the scoping meetings will help shape the scope of the study, its design efforts and the assessment criteria used in evaluating improvement options.

Additional opportunities to participate will be provided throughout the environmental review process in order to solicit feedback regarding specific needs and concerns.

HOW TO PARTICIPATE

Attend a Meeting

Tuesday, September 22, 2009
6:00 p.m. to 8:00 p.m.
Historic Pullman Visitor Center
11141 S. Cottage Grove Ave.
Chicago, IL 60628

Thursday, September 24, 2009
6:00 p.m. to 8:00 p.m.
Woodson Regional Chicago
Public Library
9525 S. Halsted St.
Chicago, IL 60628

Oral and written comments can be made at the meeting.

Comment

Provide written comments on the proposed project alternatives and potential environmental impacts. Comments will be considered in the scoping process if received by October 27, 2009.

Mail your comments to:

Jeffrey Busby
General Manager, Strategic Planning
Chicago Transit Authority
P.O. Box 7602
Chicago, IL 60680-7602

Or e-mail:

RedExtension@transitchicago.com

Comments can be submitted by mail or e-mail.

Stay Involved

For project information, visit: www.transitchicago.com/RedEIS

If you would like to be added to the project mailing list or e-list for future updates, please send your contact information to Darud Akbar, Government & Community Relations Officer, Chicago Transit Authority, P.O. Box 7567, Chicago, IL 60680-7567, call (312) 681-2708 or e-mail dakbar@transitchicago.com.

THE DECISION MAKING PROCESS AND NEXT STEPS

After the scoping period, CTA will start preliminary engineering and prepare a Draft EIS. The public will have an opportunity to comment on the Draft EIS during a 45-day public comment period. During the review period, CTA will host public hearings to receive comments on the Draft EIS from the public and agencies. CTA will then prepare a Final EIS that includes responses to public comments.

The Federal Transit Administration (FTA) will consider the Final EIS and prepare a Record of Decision (ROD) selecting the preferred alternative. Issuance of the ROD indicates that CTA has satisfied all of the requirements of the National Environmental Policy Act (NEPA). While CTA can advance on preliminary engineering concurrently with the environmental analysis, the issuance of the ROD will allow CTA to move forward with final design and construction of the Red Line.

TARGETED PROJECT SCHEDULE

Fall 2009	2010-2011	2011-2013	2016
Public Scoping Meetings, September 22 and 24, 2009	Preliminary Engineering and Draft EIS	Final EIS, ROD, Final Design, Start of Construction	Open for Operation

Extensión de la Línea Roja

Que conecta la Estación de la 95th Street a la 130th Street

Información sobre el Involucramiento al Público en la Declaración sobre el Efecto Medioambiental

Septiembre de 2009

DEPARTMENT OF TRANSPORTATION
UNITED STATES OF AMERICA

INTRODUCCIÓN

La Chicago Transit Authority (CTA) se propone hacer mejoras de transporte al extender la Línea Roja desde la estación de la 95th Street a la 130th Street. La CTA y la Administración Federal de Tránsito (conocida en inglés por sus siglas "FTA") pasarán a preparar una Declaración sobre el Efecto Medioambiental (conocida en inglés por sus siglas "EIS"), la cual evaluará los efectos medioambientales de construcción y de funcionamiento de la extensión.

PROPÓSITO DE LA EIS Y EL PROCESO DE INVOLUCRAMIENTO AL PÚBLICO

De acuerdo con la Ley sobre la Política Nacional Medioambiental (conocida en inglés por sus siglas "NEPA"), la CTA y la FTA han iniciado un proceso de estudio medioambiental para la Extensión de la Línea Roja. Se elaborará una EIS para identificar los efectos relativos a las obras de construcción y el funcionamiento de la línea. Como parte de la etapa inicial del estudio medioambiental, se celebrará reuniones para involucrar al público con el fin de recibir comentarios por parte del público sobre las alternativas y las cuestiones que deben considerarse como parte del análisis medioambiental. Estas reuniones con el público también son un requisito de la Ley sobre la Equidad del Transporte Seguro, Confiable, Flexible y Eficiente: Un Legado para Usuarios (conocida en inglés por sus siglas "SAFETEA-LU"), la cual exige que los proponentes del proyecto ofrezcan oportunidades para que participe el público en la toma de decisiones sobre el transporte.

Se conoce el proceso de determinar el alcance, el enfoque, y el contenido de una EIS como el "involucramiento al público". Las reuniones de involucramiento constituyen una oportunidad idónea para obtener información de las entidades públicas y gubernamentales. En particular, el proceso de involucramiento pide a las entidades y a las personas interesadas que expresen sus opiniones sobre las alternativas propuestas, el propósito y la necesidad del proyecto, los temas propuestos de evaluación, los efectos negativos posibles, y las medidas atenuadoras que habrán que tener en cuenta.

ANÁLISIS MEDIOAMBIENTAL

Las cuestiones medioambientales que se estudiarán en la EIS son como siguen:

- Recursos culturales;
- Flora y fauna naturales y ecosistemas;
- Uso de energía;
- Adquisición de tierras, desplazamientos, y reubicaciones;
- Uso de tierras;
- Recursos naturales (incluso la calidad del aire y los recursos acuáticos);
- Compatibilidad de los vecindarios y la equidad medioambiental;
- Tierras de parque verde/ instalaciones recreativas
- Seguridad y protección;
- Transporte;
- Efectos visuales y estéticos;
- Ruidos y vibraciones;
- Planificación por zonas y el desarrollo económico y secundario.

REPASO DEL PROYECTO

En 2006, la Chicago Transit Authority (CTA) y la Administración Federal de Tránsito (FTA) iniciaron un proceso de análisis de alternativas para la extensión propuesta de la Línea Roja. Como parte de este proceso de revisión de tres etapas, la CTA ha celebrado seis reuniones públicas durante los últimos tres años, con el fin de recoger opiniones del público sobre las alternativas posibles. La CTA evaluó nueve alternativas y ha adoptado la Alternativa del Tránsito Ferroviario Pesado (conocida en inglés por sus siglas "HRT") de la Union Pacific Railroad (UPRR) como la Alternativa de Preferencia Local (conocida en inglés por sus siglas "LPA") para mayor estudio en la EIS. Se irá perfeccionando la Extensión de la Línea Roja propuesta durante la etapa del diseño conceptual del proyecto y se someterá a mayor estudio durante la etapa de la EIS.

ALTERNATIVAS DEL PROYECTO QUE SERÁN EVALUADAS EN LA EIS

La EIS incluirá una evaluación de las siguientes alternativas:

Alternativa sin Obras de Construcción

La Alternativa sin Obras de Construcción se define como el sistema de transporte ya existente, además de las otras mejoras de transporte para las cuales ya se ha contraído el compromiso de realizarlas y que ya quedan incluidas en el Programa de Mejoras de Transporte (conocida en inglés por sus siglas "TIP") para los ejercicios fiscales de 2007-2012 dentro de la Dirección Metropolitana de Chicago para la Planificación (conocida en inglés por sus siglas "CMAP"). Los proyectos de TIP dentro del área del proyecto consisten en la reconstrucción de cinco puentes y los proyectos de mejoras de algunos caminos, los cuales incluyen la jardinería, la colocación de cercos, obras de repavimento, la coordinación de sincronización de señales, y un sendero de multiuso para biciclistas y peatones. Todos los elementos de la Alternativa sin Obras de Construcción se incluyen en cada una de las otras alternativas.

Para resumir:

- Sistema de transporte ya existente;
- Además de las otras mejoras de transporte: proyectos de mejoras de puentes y caminos;
- Servicio de tránsito por autobús que se enfoca sobre la conservación de servicios y proyectos ya existentes.

Alternativa de Administración del Sistema de Transporte (conocida en inglés por sus siglas "TSM")

La Alternativa propuesta de TSM es una alternativa de tránsito rápido por autobuses (conocida en inglés por sus siglas "BRT"), que anda entre la Estación de la 95th Street y la 130th Street, por medio de la East 95th Street, la Michigan Avenue, al East 127th Street, la South Indiana Avenue, y la East 130th Street.

Para resumir:

- Alternativa sin Obras de Construcción, además de:
- El tránsito rápido por autobuses (BRT) que anda entre la Estación de la 95th Street y la 130th Street;

- Un recorrido de 5.5 millas con cuatro paradas intermedias en la 103rd, 111th, 115th, y 130th Streets;
- Estaciones con instalaciones de estacionamiento propuestas para todas las nuevas paradas
- Anda en el tránsito mixto con señales de preferencia por la 95th Street, la Michigan Avenue, y la 130th Street;
- La terminal de la 95th Street ampliada para extender las plataformas de entrada ya existentes para los autobuses por la State y Lafayette Streets, ubicados aproximadamente 250 pies al norte a la 94th Street, con el fin de mejorar la circulación y la seguridad;
- Los autobuses que andan del sur seguirán brindando servicio a la estación de la 95th Street.

Alternativa de Preferencia Local (LPA): Alternativa de Tránsito Ferroviario Pesado (HRT) de la Union Pacific Railroad (UPRR)

La propuesta LPA extenderá la línea de tránsito ferroviario pesado desde la Estación de la 95th Street ya existente de la Línea Roja a la 130th Street.

Para resumir:

- Alternativa sin Obas de Construcción, además de:
- Extensión de la línea de tránsito ferroviario pesado desde la Estación de la 95th Street a la 130th Street;
- Una extensión de 5.3 millas con tres nuevas paradas intermedias en la 103rd, 111th, 115th, y 130th Streets y una estación terminal nueva en la 130th Street;
- Estaciones nuevas con instalaciones de estacionamiento y terminales de autobuses en cada estación;
- Anda por encima de una estructura elevada desde la 95th Street, mientras que va hacia el sur por la I-57 Expressway por casi media milla hasta llegar al corredor de la UPRR en proximidad de la Eggleston Avenue. Luego se dirigiría al sur por el corredor de la UPRR hasta aproximadamente 111th Street, donde daría la vuelta al sudeste. Al este de la South Prairie Avenue, el alineamiento cruza sobre las vías de la CN/Metra cerca de la 119th Street, donde adoptaría una configuración de andar a nivel de calle, para seguir después hacia el sudeste por la servidumbre de paso de la antigua compañía de ferrocarril periférico de Michigan Central/Indiana Harbor (Michigan Central/Indiana Harbor Belt Railroad, o IHB por sus siglas en inglés), acabando en proximidad de la 130th Street;

- Las rutas de autobuses que venían del sur serán desviadas para brindar servicio a las nuevas estaciones intermedias y terminales, con el fin de agilizar el tránsito de viajeros al centro de Chicago;
- Se estudiarán dos alternativas de alineamiento en la EIS: Se podrá colocar vías inmediatamente adyacentes a la servidumbre de paso de la UPRR por el lado al oeste (Opción del Lado al Oeste) o por el lado al este (Opción del Lado al Este);
- Se estudiarán dos alternativas para la estación terminal de la 130th Street en la EIS: La línea seguiría hacia el sur por la servidumbre de paso de la IHB hasta una estación terminal que estaría ubicada en un sitio al sur o al oeste, por el lado al norte de la 130th Street, justamente al oeste de la I-94 Bishop Ford Freeway.

Alternativa de Tránsito Ferroviario Pesado (HRT) de la Halsted Street

La Alternativa propuesta de HRT de la Halsted Street extendería la línea de tránsito ferroviario desde la estación terminal de la 95th Street ya existente de la Línea Roja para acabar en el cruce de caminos entre la Halsted Street/Vermont Avenue, en proximidad a la 127th Street.

Para resumir:

- Alternativa sin Obras de Construcción, además de:
- Extensión de la línea de tránsito ferroviario pesado desde la Estación de la 95th Street al cruce de caminos entre la Halsted Street/Vermont Avenue;
- Una extensión de 5.0 millas con tres nuevas paradas intermedias en la 103rd, 111th, 119th, y una estación terminal nueva en la Vermont Avenue;
- Nuevas estaciones con instalaciones de estacionamiento en las estaciones intermedias y terminales;
- Anda por encima de una estructura elevada entre la Estación de la 95th Street ya existente de la Línea Roja y el cruce de caminos entre la Halsted Street/Vermont Avenue, en proximidad de la 127th Street. El alineamiento seguirá el camellón o zona media de la I-57 Expressway hasta que llega a la Halsted Street. Luego daría una vuelta hacia el sur, entrando en la Halsted Street, para seguir después por la zona media hasta llegar a la Vermont Avenue.
- Las rutas de autobuses que venían del sur serán desviadas para brindar servicio a las nuevas estaciones intermedias y terminales

Se podrán identificar otras alternativas en el proceso de involucrar al público..

PROPÓSITO Y NECESIDAD DEL PROYECTO

El proyecto de Extensión de la Línea Roja tiene el propósito de reducir el tiempo de viaje al trabajo para los residentes ubicados en el lado del sur lejano y de los suburbios del sur y de mejorar el funcionamiento de la estación terminal de la 95th Street ya existente de la Línea Roja. El proyecto también daría la oportunidad para fomentar las iniciativas de desarrollo económico.

La necesidad del proyecto se basa en las siguientes consideraciones:

- La falta de estaciones con instalaciones de estacionamiento y de un lugar para dejar y recoger a pasajeros, y las instalaciones pobres para peatones limitan el acceso a la estación terminal ya existente de la 95th Street de la Línea Roja.
- Los viajeros que llegan a las instalaciones terminales ya existentes por autobús sufren de demoras numerosas que resultan del mal rendimiento de los cruces de caminos arteriales en los alrededores, del espacio insuficiente para la carga y la descarga de pasajeros en los autobuses, y del espacio insuficiente para las paradas intermedias (escalas) de autobuses.
- Las condiciones congestionadas para autobuses y pasajeros en las estaciones terminales ya existentes y en las instalaciones de autobuses resultan en los problemas de seguridad y disminuyen lo atractivo del tránsito como alternativa de otras modalidades de viaje.
- El rendimiento de las calzadas en este estudio queda perjudicado por las calles arteriales estrechas y cruces ferroviarios frecuentes de carga a nivel de calle.
- La población en el área del estudio consiste en grupos étnicos minoritarios, sumamente dependientes del tránsito, y de ingresos bajos.

PARTICIPACIÓN DEL PÚBLICO

A lo largo del proceso de la EIS, la CTA ofrecerá numerosas oportunidades para que usted quede involucrado en el proyecto de Extensión de la Línea Roja. Que usted participe activamente para dar forma a este proyecto o que simplemente prefiera estar al tanto de las últimas novedades, la CTA espera con placer su participación en los meses venideros. Para asegurar que se aborden las cuestiones que son más importantes a los residentes, a las entidades públicas, y a otras partes interesadas en este estudio, la CTA celebrará dos reuniones de involucramiento público para recoger las opiniones del público. Los comentarios que se recogen en las reuniones de involucramiento ayudarán a determinar el alcance del estudio, los esfuerzos por diseñarlo, y los criterios de valoración dedicados a evaluar las opciones para hacer mejoras.

Se ofrecerán más oportunidades para participar durante el proceso del estudio medioambiental, con el fin de pedir más opiniones sobre las necesidades y los temas específicos de preocupación.

CÓMO PARTICIPAR

Asistir a una reunión

martes, 22 de septiembre de 2009
6:00 p.m. - 8:00 p.m.
Historic Pullman Visitor Center
11141 S. Cottage Grove Avenue
Chicago, IL 60628

jueves, 24 de septiembre de 2009
6:00 p.m. - 8:00 p.m.
Woodson Regional Chicago Public Library
9525 S. Halsted Street
Chicago, IL 60628

Se pueden hacer comentarios orales y por escrito en las reuniones.

Hacer comentarios

Hacer comentarios por escrito sobre las alternativas propuestas del proyecto y los efectos medioambientales posibles. Se considerarán los comentarios en el proceso de involucramiento al público con tal de que se entreguen para el día 27 de octubre de 2009.

Enviar sus comentarios a:

Jeffrey Busby
General Manager, Strategic Planning
Chicago Transit Authority
P.O. Box 7602
Chicago, IL 60680-7602

O enviar por correo electrónico a:

RedExtension@transitchicago.com

Se pueden entregar comentarios por correo postal o electrónico.

Quedar involucrado

Para informarse sobre el proyecto, vaya al: www.transitchicago.com/RedEIS

Si usted desea incorporarse a nuestra lista de correo postal o electrónico del proyecto para recibir noticias en el futuro, favor de enviar sus datos de contacto a Darud Akbar, Government & Community Relations Officer, Chicago Transit Authority, P.O. Box 7567, Chicago, IL 60680-7567, llame al (312) 681-2708, o enviar una nota por correo electrónico a dakbar@transitchicago.com.

EL PROCESO DE TOMAR DECISIONES Y LOS PRÓXIMOS PASOS

Después del período de involucramiento al público, la CTA comenzará la ingeniería preliminar y elaborará un borrador de la EIS. El público tendrá una oportunidad para hacer comentarios sobre el borrador de la EIS durante un plazo de 45 días dedicado a los comentarios por el público. Durante el período de estudio, la CTA celebrará reuniones públicas para recibir comentarios sobre el borrador de la EIS del público en general y de las entidades. La CTA luego elaborará una versión definitiva de la EIS que incluirá las respuestas a los comentarios que habrán hecho el público

La Administración Federal de Tránsito (FTA) estudiará la versión definitiva de la EIS y elaborará un Acta de Decisión (conocida en inglés por sus siglas "ROD"), en la cual escogerá la alternativa preferida. El acto de emitir la ROD da a entender que la CTA ha cumplido con todos los requisitos que exige la Ley sobre la Política Nacional Medioambiental (NEPA). Aunque la CTA puede seguir adelante con la ingeniería preliminar de forma simultánea con el análisis medioambiental, el acto de emitir la ROD permitirá a la CTA proceder al diseño definitivo y emprender la construcción de la Línea Roja.

Environmental Impact Statement (EIS)
Public Scoping Meetings
September 22 & 24, 2009

Meeting Agenda

• 6:00 – 6:45 pm	Open House
• 6:45 – 6:55 pm	Presentation
• 6:55 – 7:55 pm	Public Comments on Scope of Environmental Impact Statement (EIS)
• 7:55 – 8:00 pm	Next Steps/Adjournment

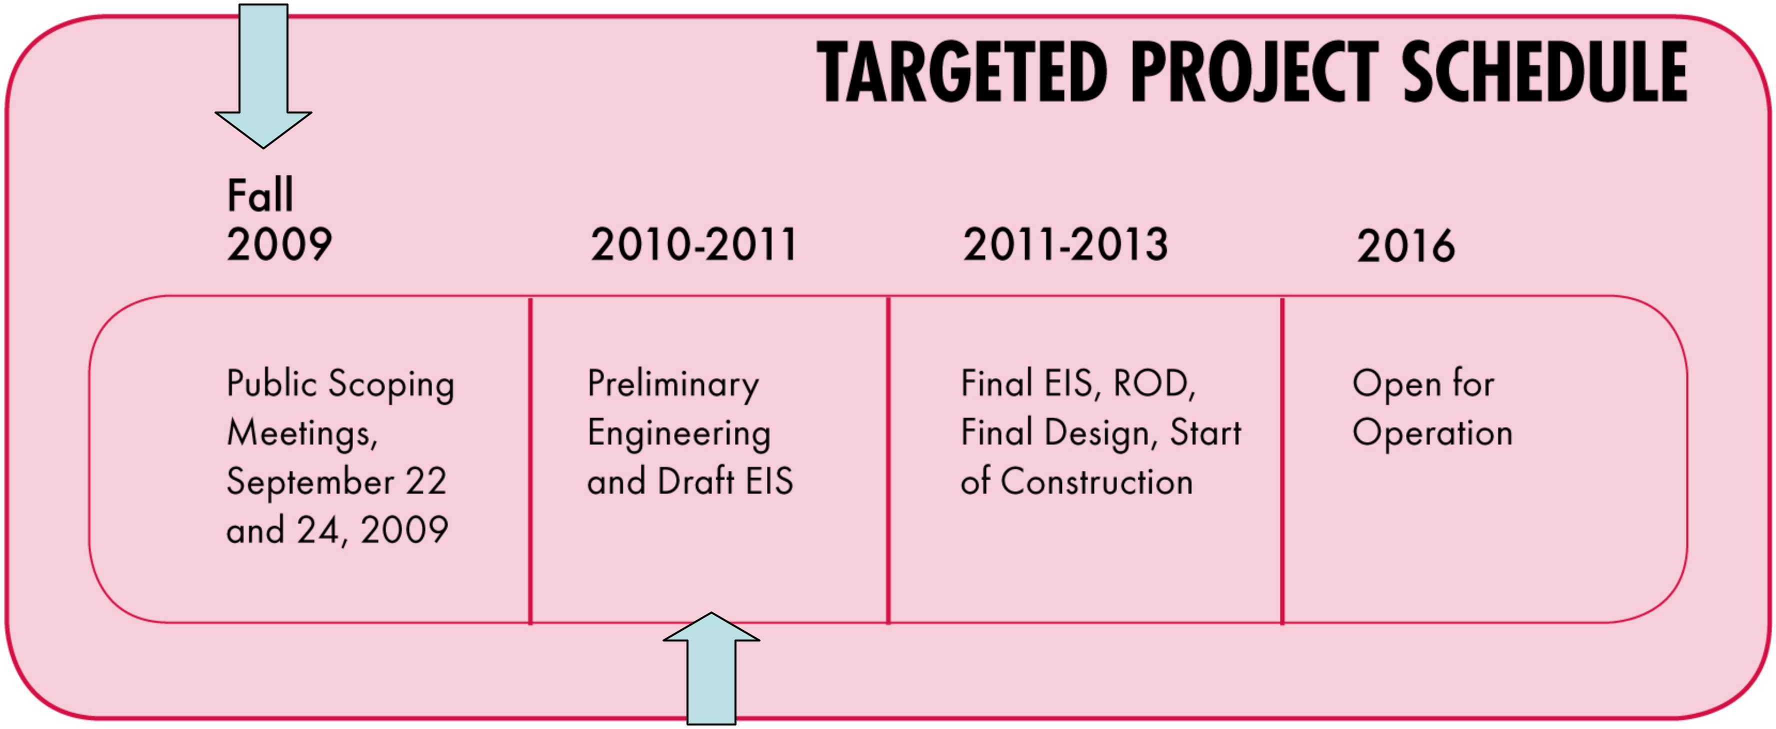
Background/History

- Alternatives Analysis process began in 2006
- Evaluated nine alternatives
- Extensive public outreach program
- Adopted Union Pacific Railroad Heavy Rail Transit Alternative as Locally Preferred Alternative (LPA)
- Environmental Impact Statement (EIS) builds on Alternatives Analysis process

Environmental Impact Statement (EIS)

- Prepared to comply with National Environmental Policy Act (NEPA)
- Identify and evaluate potential impacts related to project construction and operation
- Inform public and decision-makers of potential impacts and mitigation measures

Scoping: process of determining focus and content (scope) of EIS



TARGETED PROJECT SCHEDULE

Fall 2009	2010-2011	2011-2013	2016
Public Scoping Meetings, September 22 and 24, 2009	Preliminary Engineering and Draft EIS	Final EIS, ROD, Final Design, Start of Construction	Open for Operation

Public review of Draft EIS; relevant scoping comments addressed in Draft EIS

Project Alternatives Proposed for Study in EIS

- No Build Alternative
- Transportation System Management (TSM) Alternative
- Locally Preferred Alternative (LPA): Union Pacific Railroad Heavy Rail Transit Alternative
- Halsted Street Heavy Rail Transit Alternative

Scoping Comments

Focus comments on:

- Purpose and Need
- Proposed Alternatives
- Proposed Environmental Issues to be Examined
- Potential Environmental Effects and Mitigation Measures to be Considered

Speaker Guidelines

- Submit a speaker card
- Moderator will call speakers by name
- Re-state your name
- Speakers have 3 minutes to comment
  - ➢Yellow Card- 30 seconds remaining
  - ➢Red Card- speaking time is over
- Tonight we will not respond to your comments
- Comments will be documented in scoping report

Scoping Comments due by October 27, 2009

- Tonight verbal comments recorded by court reporter
- Write comments and place in box provided
- Mail:

  Jeffery Busby, General Manager, Strategic Planning
  Chicago Transit Authority
  P.O. Box 7602
  Chicago, IL 60680-7602

- E-mail: RedExtension@transitchicago.com
- Fax: (312) 681-4297

Appendix J
Meeting Exhibit Boards

No Build Alternative

- Existing transportation system
- Plus committed transportation improvements in Chicago Metropolitan Agency for Planning Transportation Improvement Program including select bridge and road improvement projects
- Focus on preservation of existing bus service

Transportation System Management (TSM) Alternative

Bus Rapid Transit (BRT) alternative that operates between the 95th Street Station and 130th Street via East 95th Street, Michigan Avenue, East 127th Street, South Indiana Avenue, and East 130th Street.

- 5.5 miles long with four intermediate stops at 103rd, 111th, 115th and 130th streets
- Park & Ride facilities proposed at all new stops
- Operates in mixed traffic with traffic signal priority along 95th Street, Michigan Avenue, and 130th Street
- 95th Street terminal expanded to extend the existing bus bays along State and Lafayette streets to 94th Street to improve circulation and safety
- Existing buses from the south would continue to serve the 95th Street Station

Locally Preferred Alternative (LPA):

Union Pacific Railroad (UPRR) Heavy Rail Transit (HRT) Alternative

Locally Preferred Alternative (LPA): Union Pacific Railroad (UPRR) Heavy Rail Transit (HRT)

Extend Red Line rapid transit from the existing Red Line 95th Street Station to 130th Street.

- 5.3-mile extension with three new intermediate stops at 103rd, 111th and 115th Streets and a new terminal station at 130th Street
- New Park & Ride and bus terminal facilities at each station
- Buses from the south would be re-routed to serve the new intermediate and terminal stations to speed passenger travel to downtown Chicago

Halsted Street Heavy Rail Transit (HRT) Alternative

Extend Red Line rapid transit from the existing Red Line 95th Street station to Halsted Street/ Vermont Avenue intersection in the vicinity of 127th Street.

- 5-mile extension with three new intermediate stops at 103rd, 111th, 119th streets and a new terminal station at Vermont Avenue
- New Park & Ride facilities at intermediate and terminal stations
- Buses from the south would be re-routed to serve the new intermediate and terminal stations

Project Purpose

- Reduce travel times to jobs for Far South Side and South Suburban residents
- Improve performance of existing Red Line 95th Street Station terminal
- Provide an opportunity to support economic development initiatives

The need for the project is based on the following considerations:

- Lack of Park & Ride, passenger drop off and poor pedestrian facilities limit access to existing 95th Street Red Line terminal station
- Customers accessing existing terminal facility by bus experience measureable delays
- Congested bus and passenger conditions at existing terminal station and bus facility result in safety issues and diminish the attractiveness of transit as an alternative to other travel modes
- Roadway performance in study area is adversely impacted by narrow arterial streets and frequent at-grade freight rail crossings
- Study area population is highly transit dependent, minority and low-income

CHICAGO TRANSIT AUTHORITY
PUBLIC HEARING
"RED LINE EXTENSION
CONNECTING 95TH STREET STATION TO 130TH STREET"
September 22, 2009

STENOGRAPHIC REPORT OF PROCEEDINGS

had in the above-entitled matter held at the Historic Pullman Visitor Center, 11141 South Cottage Grove Avenue, Chicago, Illinois, commencing at 6:44 o'clock p.m.

PRESENTERS:

MR. DARUD AKBAR, Government & Community Relations Officer, Chicago Transit Authority

MR. JEFFREY BUSBY, General Manager, Strategic Planning, Chicago Transit Authority

MS. SARAH LAYTON WALLACE, Moderator

Reported by: Anna M. Morales, CSR, RMR
License No.: 084-002854

(Whereupon, the following proceedings commenced at

6:44 o'clock p.m.)

MR. AKBAR: Good evening, everyone. If we could have folks begin to take their seats, we would like to go ahead and get the presentation started.

Good evening. Once again, my name is Darud Akbar. I'm the Government & Community Relations Officer with the Chicago Transit Authority. I would like to welcome everyone to the CTA's public scoping meeting for the Red Line Extension Project. Before we begin the presentation, I would like to acknowledge Lorie Lipson. She is representing Alderman Austin's office. If you could just raise your hand, Lorie. Thank you.

I'm going to turn things over to Sarah. Sarah is going to give us a talk about the meeting agenda tonight, and then we're going to go ahead and begin the presentation shortly.

MS. WALLACE: Thank you. Before we get started, I just want to check, is there anyone that will be in need of Spanish translation this

evening? We do have that service available.

Tonight, as you see our agenda, we are just completed with the open house portion of the agenda, and now we're going to move into the presentation that's going to be about a ten-minute presentation, and Jeff Busby from CTA is going to make that presentation to you, after which we'll move to our public comment period. And just before the public comment period, I'm going to go through some guidelines with you so that you have an understanding of how that process works and your time limitations and so forth that you have.

At the conclusion of the public comment period -- and I will just say that if it's not 8 o'clock yet and we've gotten all the comments initially, we are going to remain here to take public comment until 8 o'clock as we gave you notice, and then we'll just go over some next steps before we adjourn the meeting.

So with that, let's turn it over to Jeff for a presentation.

MR. BUSBY: Hi. Thanks, Sarah. Thanks all for coming out.

I'm Jeff Busby. I work in the Planning

Department at CTA. I see quite a few familiar faces from our previous work.

Just a little bit of background on the Red Line Extension Project. The idea to extend the Red Line has really been around since the 1970s; but we, at CTA, got very busy with the first and foremost stage of a federal process to begin to apply for money back in 2006 when we started an Alternatives Analysis study.

The purpose of that study was to look at a whole range of transportation options to improve the service in the study area to the far south side and the south suburbs. We looked at different transit technologies or modes, different corridors, different profiles where the transit would be in relationship to the street level.

We had three rounds of public outreach. Very strong attendance at all of those. We had some really nice media coverage.

Recently, in August, we concluded that study when the Board of the CTA adopted the Union Pacific Railroad Alternative as the Locally Preferred Alternative. That will be one of the alternatives we'll look at in the environmental

studies. I will talk a little bit about that in more detail. But this environmental study which we're starting right now really is a culmination -- it starts from the work we did in the Alternatives Analysis and advances that into significantly more detail.

Why are we doing this? Well, we would like to use federal funds, at least a portion of the federal funds, to help pay for an extension to the Red Line. To spend large amounts of federal money on really anything, you need to comply with the National Environmental Policy Act which requires that you identify potential impacts both positive and negative to the environment from the construction and operation of a rapid transit facility. So we're starting that process tonight.

The purpose of preparing this document is both to inform members of the public about the likely impacts, but to also help decision-makers who will pay for and be responsible for operating the line about the impacts and how we might mitigate those impacts that are adverse to the community.

Here's a schedule for you, just to give

you a sense of where the project is and where we would like to go. This is a target. It's not something that unfortunately I can guarantee for you. But we're going to start this evening receiving your comments on what you would like us to study in the environmental review. We're going to study that over the next year and share a draft of the Environmental Impact Study at the end of 2010 or perhaps early 2011.

At that stage, we need to ask the federal government for additional money and for permission to begin final design. That's the preparation of really the construction drawings. We hope for that period to last between 2011 and 2013. At that point, we need to have identified all the funds for the start of construction. If those funds were available and, again, if we got federal permission, we would like to start construction in 2013 to open in 2016.

I think this is a realistic schedule. It is ambitious. Certainly your support is helpful in making that realized. I mentioned that we'll be studying the Locally Preferred Alternative which came out of the Alternative Analysis Study; but

there are also three alternatives that will be studied as part of the Environmental Impact Study.

The first is a No-Build Alternative. That becomes a point of comparison, so what would be the environmental impacts of not doing anything.

The second is a Transportation System Management Alternative. It's a long word, but what it really means is a lower cost alternative to building the Red Line; and, in this case, it would be express buses and some improvements at 95th Street so that those express buses could have a place to drop people off.

The Locally Preferred Alternative, there are maps in the back and we'll be talking about that in more detail. That's an extension of the Red Line from 95th Street following the Union Pacific Railway with stations at 103rd, 111th, 115th and Michigan, and a final station at 130th. It's an elevated extension, so it's above the street level but adjacent to those Union Pacific freight tracks.

And, finally, another alternative in the

Alternatives Analysis that performed very well that we thought we would include in the environmental

study as a point of comparison was an elevated extension along Halsted Street. It would be elevated above the median of that street. Similar, four stations at 103rd, 111th, 119th, and 127th and Vermont.

This is a map of the Locally Preferred Alternative. As I mentioned, it leaves 95th Street, travels in the median of I-57, and then is an elevated line above the street level traveling next to the Union Pacific Railroad. It ends at 130th and the Bishop Ford, very close to Altgeld Gardens.

And, similarly, the Halsted alternative which leaves 95th Street, again using the median of I-57, travels south elevated above Halsted, ending at 127th.

So we're very interested in your comments tonight. Sarah is going to help us with rules on how that's all going to work and I will turn it over to her.

MS. WALLACE: Okay. Thank you very much. So it's time for the public comment process, and I want to go over some of the guidelines.

First of all, so that you know, we would like you to focus your comments on the work that we have ahead, which is the purpose and need for the project; the proposed alternatives; the proposed environmental issues to be examined; and the potential environmental effects and mitigation measures to be considered. So those should be the focus of your comments tonight.

The guidelines. If you would like to speak and if you haven't done so already, you will need to fill out one of these speaker cards. Christy will be happy to collect those and bring them to me. I will plan to call speakers up in the order that I have received them. And I will call a couple at a time so that you can go ahead and get lined up and know where you're coming.

When you come to the microphone, I'd ask you first to restate your name so we get that for the record. We have a court reporter here who's going to be documenting your comments. And we would ask you to direct your comments to CTA here at the front table.

You're going to have three minutes to comment. And the good news is you're not going to have to keep track of the three minutes. We got a

stoplight here so everyone can see that. When you begin your comments, the stoplight will be green. When you have got about 30 seconds left, the stoplight will turn yellow; and then it will begin flashing when you have 15 seconds. So you should be able to gauge your comments and know when you need to be wrapping up. Once that turns red, that means your comment time is up.

We would ask everybody to stick with that comment period. The only exception to that is anyone who needs translation, we're going to allow six minutes because of the time that it takes to go back and forth with the translator. So be aware of that.

Tonight, we're really here to hear what you have to say. This is your chance for input on the process. CTA is here to listen to you. And so they won't be responding to your comments in any way at this time, but your comments are going to be documented in a scoping report.

So that's the process. Hope that's clear to one and all, and we're ready to get started.

Okay. We have -- the first couple are Helen Rockingham, Derrick Brownlee, and Reverend

Isaac Hayes. You want to get situated at the microphone. And, Helen, please go ahead and restate your name first.

MS. ROCKINGHAM: My name is Helen Rockingham. I would like to say good afternoon to everyone. I would also like to give my appreciation to CTA -- express my appreciation to CTA for this effort.

It's been long past due, and there are a lot of residents who are going to appreciate having this kind of facility available to them.

Myself, I'm a rider on CTA's Red Line train and buses at some point in time to work everyday. And what I find at 95th Street is that the parking is nonexistent and we're always getting traffic tickets there. So these lines and the proposed parking spaces that would be available at the different terminals would be a plus for this project to us, to the community, and we appreciate that, if the project becomes finalized.

Another thing is I'm a property owner and that Pacific line comes right past my home. As a matter of fact, I'm the second house from that line, south of that line on Princeton. And the environmental impact, I know for the benefit of the

community, if we have to be relocated, that would not be an issue to some homeowners, but CTA's obligation to us, when will we find that out or if it would be found out in the 2013 year, and how would those -- how would those homeowners be contacted and at what point, would be my question.

Okay, I'm still on green. Great. Yes, it appears that the preferred route would be the Pacific line. I have been bouncing this, brainstorming with a lot of neighbors, and we see Halsted would be the least route for the advantages for the businesses and traffic going to the expressway. We just know we will see the benefits of it in our neighborhood, and that's the end of my comments. Thank you.

MS. WALLACE: Derrick Brownlee. Derrick Brownlee? Okay. Reverend Isaac Hayes.

REV. HAYES: Reverend Isaac Hayes, candidate for U.S. Congress in the Illinois 2nd Congressional District, and I just want to commend the CTA for taking this step. Certainly I know many residents and citizens on the south side have long wanted this, and people are happy they will have an easier commute to work or to school or wherever they may

go. And so I don't need the full three minutes. I just wanted to commend the CTA, and the residents on the south side are very happy for this step. Thank you.

MS. WALLACE: Robert Franklin and then Charlie Yale.

MR. FRANKLIN: All right. My name is Robbie Franklin. I would like to know if you're going to run the El starting at 99th and Eggelston, are you going to be on that platform on the tracks to the Pacific or are you going from the west side or the east side? And are you going to damage the little park that's in there between 99th and 103rd?

MS. WALLACE: Do you have other comments?

MR. FRANKLIN: No. That's it.

MS. WALLACE: Charlie Yale and then Eugene Taylor. Please restate your name.

MR. YALE: I'm Charlie Yale from Citizens Taking Action. I work with the unions and I got a high seniority.

It's a wonderful thing that CTA is doing right now with that extension. If the economy picks up and the recession gets better in the near future, where are you going to extend the Red Line?

How far out may I ask? How far out? The Red Line, how far out will it go out? How far in distance, north or south? May I ask, please?

MS. WALLACE: Right now we're in the public comment portion, so we're just listening to you, but that's the kind of discussion you can have as you are looking at the board.

MR. YALE: Fine. If this works out for the public and everybody else, it would be a wonderful thing. Let the economy pick up with the recession. Right now, it's pretty bad right now. If this could be done, it would be a wonderful, wonderful thing for everybody and everybody. I want to see what happens. Analyze this.

There's construction going on I heard. This I heard. But this could be done by everybody and be one good thing for the future. I want to see what happens.

MS. WALLACE: Eugene Taylor and Michael Bryant.

Eugene Taylor?

MR. TAYLOR: Yes.

MS. WALLACE: Please restate your name.

MR. TAYLOR: My name is Eugene Taylor, and I'm here to represent Developing Communities Project.

We are a faith-based community organizing agency that has served the Chicago community areas of Greater Roseland since 1986.

In 2003, DCP began organizing a transportation campaign advocating for the expansion of rapid transit on Chicago's far south side. DCP through its CTA Red Line Oversight Committee, or RLOC, comprised of community residents, churches, community leaders, and local grass root organizations initiated a referendum drive in 2004 that resulted in 38,000 votes supporting the extension of the CTA Red Line along the Union Pacific Railroad Corridor.

We have come to recognize the critical importance of mass transit to Chicago and its residents. From the increased exposure to air and noise pollution throughout the region to the increased travel time imposed upon both workers and students, addressing our mass transit service needs was and is paramount to our community's future and its quality of life. This community has paid a high price for this urban transit dilemma.

But today is a good day. This day is long awaited by many and fully expected by some,

expected because the public's desire for economic justice and equity in capital spending decision-making was reasonable. Yet, its anticipation for nearly 40 years has become an urban legend.

So, today, we thank the Federal Transportation Administration for requiring this public hearing, and we thank the CTA, the Chicago Transit Authority, for selecting the Union Pacific Rail route as the locally preferred route.

We here today want to register our initial public comments as part of the scoping process. On September 18th, 16 members of DCP's Red Line Oversight Committee toured the Union Pacific Railroad route to examine the physical and environmental conditions along the corridor.

MS. WALLACE: 30 seconds.

MR. TAYLOR: The RLOC participants documented parkways, homes, small businesses, and tracks and so forth.

Much like the Federal Transportation Agency, the DCP Red Line Oversight Committee will be listening to the CTA's environmental impact consultant's statement. Our committee will continue our review of the locally preferred route, the environmental and engineering requirements. We'll conduct and assemble additional public comments.

MS. WALLACE: Thank you.

MR. TAYLOR: And thank you.

MS. WALLACE: We look forward to written comments for those of you who have more than you can say during your three minutes. Michael Bryant.

MR. BRYANT: (Through an interpreter). Hi. My name is Michael Bryant, and I have been dreaming of this for like a long time. It's amazing how this idea is very similar to what I dreamed about. And, of course, I prefer the UPR route. You know, I prefer that very much because at 95th Street, there's really a lot of traffic there. Like I went there and I went to the other meeting and I tried to explain, but I just want to know what they're going to do for the future. I mean, we discussed like what the plans might be.

I think it's great if the 95th Street line could be set up, you know, on 130th Street, and if they could add that, that would be perfect. But I know the choice -- the decision hasn't been made.

It's a future decision, but I know it's going to be a speedy process -- I know it's not going to be a speedy process. And there's a lot of things that are going to have to change, but I think the environment will change rapidly with the changes that are going to be made by the CTA. Thank you.

MS. WALLACE: Okay. Ernest Williams and then Lou Turner. Ernest Williams?

MR. WILLIAMS: Coming. Good evening. My name is Ernest Williams, and I'm here on behalf of the Golden Gate Community Association.

The one question that I had was when the Orange Line was extended southwest to Midway, I'm sure that these same studies were done. I think it would be -- it would benefit us to talk to some of the leaders that helped implement that plan and live through the process to see what the line impacted and what the community concerns were at that time to give us something to compare to if you had those feasibility studies that you probably started back when that happened so that we can put it possibly together. Just a thought.

MS. WALLACE: Okay. Lou Turner and then David May. And please restate your name.

MR. TURNER: Hi. My name is Lou Turner. I'm with the Developing Communities Project. You have already heard from the president of our Red Line Oversight Committee.

I think a number of people here already know that the Developing Communities Project has been mobilizing the community and interest and opinions in the community around this project since 2003. And we put together a historic referendum in 2004 in which 39,000 voters in the 9th and the 34th Ward voted for this very project. And that's one of the things that the CTA has included as part of the reasons for their selection for the Locally Preferred Alternative.

I have a few things and I will submit it also in a written form, but in the instructions, particularly in the introduction to the folder that you have here, it says that -- the EIS scoping info says that the CTA and the FTA will be preparing the EIS. How will the FTA participate in the preparation of the EIS?

Secondly, what weight will public comment have in the decision-making process of the EIS and the preliminary engineering?

Thirdly, what governmental agencies will also participate? Because it says public comment and governmental agencies or agencies will participate in the scoping process. Will their comment and analysis be made public? If so, where? I assume the EPA and people like that. What weight will their input, that is, the governmental agencies, carry? And if there's a conflict between the input of the public agencies -- excuse me, the governmental agencies and the public comment, how will these conflicts be resolved?

You mentioned the proposal for topics of evaluation. One, it seems to me, especially for environmental impact that becomes important, is to identify brown fields along the route. I assume that there is some kind of map somewhere or there's some process at hand in terms of identifying -- 30 seconds -- identifying brown fields.

Secondly, if these brown fields are identified, I want to know what the process is for minority procurement opportunities for mitigating those brown fields.

And, lastly, what are the scoping -- what is the scoping analysis going to do in terms of

identifying transit-oriented development opportunities along the route?

MS. WALLACE: Thank you.

MR. TURNER: Thank you.

MS. WALLACE: David May and Harry Brooks.

MR. MAY: I'm David May. I'm here speaking as an individual. I think it's a very valuable project for underserved communities here on the south side, and I think these extension projects are great in terms of leveraging the existing facilities.

The cost estimates I have seen for the LPA seem very high compared to similar projects that have been built in other countries. CTA has a bad record in terms of managing large construction projects, and I recommend that you look at the Army Corps of Engineers' Early Contractor Involvement Process; P3 processes being used in Alberta and Ontario; FDoT's recent I-95 procurement; and how BART is doing the Oakland Airport Connector.

In looking at this extension, I thought the design criteria that should have been used would be to maximize the number of customers living within a half mile of a station. So you need more

stations and you need the routes running through residential neighborhoods; avoiding overlapping coverage with METRA; using existing rights-of-way; running on ground as much as possible; and serving Chicago State and Olive-Harvey.

I think a preferable way to design this thing which I think you should consider as one of your alternatives is a one-way loop, a 9 and a half mile long loop, one-way loop, instead of your 5 mile two-way design could give you seven stations, for example, at Ford and Rhodes, 103rd and Dauphin, 111th and Langley, 115th and State, 114th and Halsted, 107th and Racine, and I-57 and Halsted which would serve many more people within walking distance in your design.

It would give you 2 miles on ground in the Bishop Ford right-of-way. It would give you 2 miles on ground on the I-57 right-of-way; 1 mile on ground on the abandoned railroad right-of-way;

and 3 miles on ground in the excess railroad right-of-way, all which are great improvements compared to your mostly elevated, very expensive guideway design. Thank you.

MS. WALLACE: All right. Harry Brooks and

William James. Harry? William, you will be after.

MR. BROOKS: Good evening. One of the things that needs to be done immediately is something to relieve the bus turn-around at 95th and the Dan Ryan, because the number of buses that go in and out of there, they have outgrown that terminal.

When I was coming here this evening, I happened to get there in just one of those rare moments. I'm sure it was like a perfect storm. All the bus lines, CTA and PACE, plus a Greyhound all were in the station at the same time. And that was interesting to watch, but it caused quite a traffic jam.

So I would hope, of course, when this extension is put in that some of those lines that go up to 95th Street now would go to the new stations or that something be done somehow, even though it's kind of landlocked, to expand the terminal because you get all -- you get everybody in there at the same time and it just doesn't work.

The 111 bus that I took to get over here stops behind the Number 106 bus, for example. And the Chicago Police Department decided to park a paddy wagon next to where the Number 106 takes some

recovery time. So I wasn't late or anything, but we had to sit there until it was time for the 106 to leave, and there were a couple of other buses that were trying to get out.

Now that particular problem could be dealt with if CTA told the police that they would have to park large vehicles elsewhere. But something still needs to be done now and in the future for that 95th terminal because, as I said before, and I'm repeating, I know, if everybody is in there at the same time, it's not working. Fun to watch, but I'm sure it's not fun for the drivers.

MS. WALLACE: Okay. William James.

MR. JAMES: Okay. My name is William James. I've lived in Roseland all my life.

MS. WALLACE: Could you please speak into the microphone?

MR. JAMES: Yeah. I came here as a teenager. I'm very familiar with Roseland, all parts of it. I have lived all over the community.

I have also lived near train tracks. Where I'm at presently, I'm near that Union Pacific. My concern is noise, vibration, property damage. What happens is these trains roll past.

Right now, there's a group in our community trying to stop the whistle blowing of the train there. Okay. They're not very successful. They have been campaigning for years. It's not stopping. The train is still blowing the whistle. The noise goes on. I lived there 20 years. I'm now oblivious to it. Other people are not.

With a CTA train running down your mysteriously preferred location -- I don't know who prefers this -- I'm going to have constant noise. I'm telling you now, I don't want you. Go away. Go down Halsted.

I have another issue there. With these train tracks and these stations, I'm going to get dirt. I'm going to get crowds there that I don't want in my backyard. I live very close to 103rd. I don't want you in my backyard. I don't want you crawling through my yard going to the train station. It's an issue for me. Okay?

Another thing that disturbs me is that through these vibrations, they damage the foundations to your homes. Many people who live close to this train have cracked foundations. CTA is going to come, they're going to build their

26

little train, you're going to go ahead about your business, I'm going to be stuck with damage, more home damage. Okay? I don't want it. These are just issues that concern me.

You're only going to build on one side of the track. Many people are thinking that they're going to get money through eminent domain. You're going to come in and pay them and they're going to move off happy. But there's two sides of that track. When you build that train, elevate it, it's going to be running through some of your bedrooms. That train is up over your head. Only one side is going to get paid. The other people are going to get stuck. And I think we need to keep this in mind. This is not about money. This is about where we live and about our comfort. Thank you.

MS. WALLACE: Are there other folks who would like to comment this evening? Okay. We're going to be available until 8 o'clock to take comment if additional people come in or you decide you want to comment.

For those of you who don't, let me go over a couple of things. If you want to leave, you can leave. If you want to spend some more time at the

board, you are welcome to do that.

So, again, tonight the verbal comments were reported by our court reporter. There's other ways that you can submit your comments. So you can write comments and place it in the box over here. You're welcome also to mail your comments to the contact and contact information listed here. You can e-mail or you can fax your comments.

We also encourage you to keep updated on what's going on with the project, and a couple ways to do that, one is to regularly go to the Web site that you see here on the screen or you can join the e-mail mailing list by writing to Darud.

So thank you so much for your input this evening. We appreciate it. And, again, we'll be available for comment until 8.

(Whereupon, there were no further speakers.)

(Public Hearing adjourned at 8 o'clock p.m.)

Certified Shorthand Reporter

CHICAGO TRANSIT AUTHORITY

PUBLIC HEARING

"RED LINE EXTENSION

CONNECTING 95TH STREET STATION TO 130TH STREET"

September 24, 2009

STENOGRAPHIC REPORT OF PROCEEDINGS had in the above-entitled matter held at the Woodson Regional Chicago Public Library, 9525 South Halsted Street, Chicago, Illinois, commencing at 6:48 o'clock p.m.

PRESENTERS:

MR. DARUD AKBAR, Government & Community Relations Officer, Chicago Transit Authority

MR. JEFFREY BUSBY, General Manager, Strategic Planning, Chicago Transit Authority

MS. SARAH LAYTON WALLACE, Moderator

Reported by: Anna M. Morales, CSR, RMR

License No.: 084-002854

(Whereupon, the following proceedings commenced at 6:48 o'clock p.m.)

MR. AKBAR: Good evening, everyone. My name is Darud Akbar. I'm with the Government & Community Relations Department at the Chicago Transit Authority. I want to welcome and thank everyone for coming to the Red Line -- this is actually our second public scoping meeting. So I want to thank you for coming out this evening.

I'm going to turn things over to Sarah. Sarah is going to talk to us about tonight's agenda, and then we're going to go into a brief presentation and come back to Sarah to explain what our rules and regulations are for this evening. So thank you once again.

MS. WALLACE: Great. Good evening. Before we get started, I want to check, is there anybody in need of Spanish translation? Okay. So we have that service if anyone is in need of that.

As you see from our agenda this evening, we've just completed the open house portion of the meeting. In just a moment, I'm going to turn it over to Jeff Busby, and Jeff is going to give a

brief presentation on the project, and then we're going to go into the formal public comment period of the meeting. And right before we do that, I will walk through some guidelines. We are going to be limiting comments to three minutes. So be thinking about that now as you are composing your thoughts, those of you that are speakers. I will go over some other things to get us on track. After the public comment period, then we'll go over some next steps and adjourn the meeting.

And I do want to note that if we conclude before 8 o'clock, you will be, you know, free to leave if you want at that time, but we are going to stay here and available for anyone who arrives and still wants to comment. So we'll remain here until 8 o'clock for sure.

So with that, Jeff will provide a presentation.

MR. BUSBY: Hi. Thanks for coming out again. I'm Jeff Busby. I work in the Planning Department at CTA.

I wanted to give you a background on where we are on the Red Line Extension. Really, the idea for bringing the Red Line further south has been

around for a very long time. In the 1960s, when they were building the freeways, they left space for a Red Line Extension; and, recently -- and this is not a new problem -- but recently the CTA has started a study called an Alternatives Analysis, and that study is intended to look at a whole range of transit options to try to improve some of the transportation problems south of 95th Street.

Many of you are aware, if you take CTA, that the 95th Street station is very crowded. There's lots of buses going there and there's lots of delays associated with getting there. So people have very long trips sometimes to get to the existing station.

So what we could accomplish with an extension of the Red Line is shorter and faster trips for people to get to CTA services as well as solving some of those congestion problems at the 95th Street station.

As I mentioned, we started this study in 2006. We looked at a whole range of options and identified a couple of options which we're going to talk about tonight which we're advancing into this next step. Part of the Alternatives Analysis

included public involvement. So we've been to Woodson Regional a couple times and actually had a series of other meetings -- three rounds of meetings with six total meetings prior to this leading up to tonight's recommendation.

The local -- I'm sorry. The Alternatives Analysis ended in August when the Chicago Transit Board adopted what's called a Locally Preferred Alternative. It's the one option that, resulting from the study, looks to be best at solving the problems we've identified, and that is an extension of the Red Line, following or running next to the Union Pacific Railroad at about 400 west. I will show you a map in a moment.

So tonight's meeting starts the

Environmental Impact Statement which very much relies on the previous work we completed in the Alternatives Analysis.

So what's an Environmental Impact Statement? The CTA is hoping to use -- to ask for federal money to pay for a portion of the extension; and any time you use federal money for a large project, you have to comply with the National Environmental Policy Act. And the National

Environmental Policy Act, or NEPA, requires that the CTA in a public setting identify and evaluate the potential impacts of both building an extension and operating an extension for the Red Line.

And the idea here is to help us make decisions about the environmental impacts and where -- and they're both positive and negative environmental impacts -- but where we identify negative environmental impacts, come up with potential ways to mitigate those, make them less adverse.

This is a schedule which gives you an idea of where we're headed. As I mentioned, we're starting the environmental process tonight with these scoping meetings. We had a meeting, very same presentation, a couple of days ago on the same subject. We're receiving input on what we should study in this environmental process.

We'll come back to you next year with the results of the environmental process in what's called a draft EIS, a draft Environmental Impact Study, and that's your opportunity to review both the impacts we've identified and what we proposed to mitigate them.

At the same time, we're going to be asking the federal government for additional funds and permission to start more detailed engineering. That's called preliminary engineering on this map. We think that process would take about two years. And so by 2013, we would need to have identified all of the money, both the federal and the nonfederal share, to fund the extension, and we would need federal permission to begin the final design.

2013 would be the year in which we would start construction. We show a three-year construction period; and the Red Line Extension opening for operation in 2016.

It's important to point out that this is our targeted schedule. It's not something we can guarantee. There's a couple of reasons for that. As I mentioned, we rely on additional funding from Washington, D.C., to continue these studies, and we also rely on permission from the Federal Transit Administration. But we think this is an achievable target and we're going to pursue it.

We're going to study alternatives, project alternatives in the Environmental Impact Study.

This is a list of them. The first alternative is a No-Build Alternative. It's really important as a point of comparison. What this alternative is is what would be the impact to the environment of not doing anything?

We're also going to study what's called a Transportation System Management Alternative. That's a very long name, but what it means is a lower cost alternative to building a rail extension. In this case, it would be an express bus service with limited stops; some technology to help speed the buses down the road through giving them priority to traffic signals; and a pretty significant expansion of the station at 95th Street to make the buses in that corridor work better as well as accommodate new buses in this alternative.

We also will be studying what's called the Locally Preferred Alternative, an extension of the Red Line following the Union Pacific rail right-of-way, an elevated extension, I should point out.

And we have identified a fourth alternative which is also an extension of the Red Line but follows Halsted Street.

Let me show you a map of the Locally Preferred Alternative. So starting with the map on the left, the Red Line would run south from 95th Street in the middle of the I-57 highway, and then it would climb up out of the highway and run elevated at about 400 West Eggelston Avenue and would travel next to the Union Pacific rail right-of-way all the way south to 130th. It would make four stops. The stops are at 103rd, 111th, 115th and Michigan, and 130th and the Bishop Ford Expressway close to Altgeld Gardens.

We're also showing two options here, the reason there's two dotted lines. We have a choice of being on the east or the west side of the freight rail tracks.

The Halsted alternative is a similar link. It runs about a half mile to the west. So, again, the train would use the median of the expressway, I-57, traveling south. When it gets to Halsted Street, it would go into the air and run down the middle of Halsted Street, above the street. It would make four stops again at 103rd, 111th, and 119th, and at Vermont which is about 127th.

This is an elevated structure. The

columns to support the elevated structure would be made of concrete most likely and be placed in the median of Halsted Street.

So those are our four alternatives. We are interested in your comments tonight. I'm going to turn things over to Sarah to give you some instructions on how we're going to receive those.

MS. WALLACE: Okay. It's time for the comment portion of our meeting; and, as promised, I want to go over a few things with you.

Because we're working on this environmental study, there are sections that we need to write and we need your input in order to do that. So we would ask you to focus your comments tonight on these areas: The purpose and need for the project; the proposed alternatives; the proposed environmental issues to be examined; and the potential environmental effects and the mitigation measures to be considered. So those are the areas we specifically need your input.

Some guidelines. If you haven't done so already, please submit a speaker card, and we can collect those and they will be brought up front. I'm going to call speakers by name. I will

probably call several at a time so that you can get lined up and prepared to speak. Here's the mic you will use, the standing mic on that side.

The first thing you will want to do is restate your name. I may not get the pronunciation right, and we want to make sure that we have that right for the record. We've got a court reporter here that is going to be documenting your comments.

You'll have three minutes to comment. The good news is you're not going to have to try to keep track of where you are in that three minutes. We have this stoplight here that is going to assist you in that process. So once you start, we'll turn that on and the green light will turn on, and that lets you know that your three minutes are starting. Once you have 30 seconds left, the light will go yellow. And once you have 15 seconds left, the light will be flashing yellow. So that kind of helps you gauge wrapping up your comment. And once it turns red, that means your comment period is up.

So we would like everyone to keep to the three minutes so that we can keep things moving and we're hearing from everyone who wants to speak tonight.

Because we're here tonight to hear from you -- that's the whole purpose of the meeting is to hear your comments -- CTA is not going to be responding to your comments tonight. We're going to be listening. We're going to be documenting and all your comments will be documented in the report.

So we would ask you to -- there are two folks from the CTA here. We would ask you to direct your comments to them, but do, again, keep an eye on the light.

So our first speakers up: Thomas Brown,

Senior, followed by Rob Kelsey, and I believe this is McClellan. So are those folks here?

Yes. And I do want to remind everybody, if you haven't done so already, turn off cell phones or pagers or at least change the setting to vibrate so that we don't cut into people's time that are speaking.

Could Thomas Brown, Senior, please approach the microphone? Go ahead.

MR. BROWN: Again, my name is Thomas Brown, Senior. I live directly in the area where the proposed train will be built and constructed. My comments center around myself as well as my

neighbors. I'm right on 325 West 99th Place, directly in front of Wendell Smith Park, and most of my neighbors are senior citizens.

So in the environmental study, I would like for you all to take into consideration the fact that a lot of the homeowners are senior citizens and the fact that we would want -- we don't want to be -- they don't want to be disrupted unduly, and just to take those factors into consideration in the environmental study, as well as Wendell Smith Park is a park that is utilized, and also to look at, in addition to what you're already studying, the noise impact and the safety impact of that park.

Another comment I would like to make is

the fact that the proposed plan going down Eggelston Avenue, it's very residential, and there's definitely some concern about having a commuter line directly through the residential corridor that's there. Those are my comments. Thank you.

MS. WALLACE: Thank you. Rob Kelsey, and then McClellan, and then Dorothy Boyd.

MR. KELSEY: Good evening, everyone. My name

is Robert Kelsey. I'm a Chicago Public School counselor. I work in the West Pullman area, Gompers Fine Arts Option School.

As a counselor, I fill out numerous applications, help students fill out applications for high school. And being an educator, I also recognize that a number of students don't get downtown unless it's a field trip a lot of times. So this new Red Line or -- I'm not sure exactly what this -- Red Line Extension will be helpful in a lot of aspects.

I heard the speaker before me. He had a lot of excellent concerns there, but I think there's also some advantages for some of our younger people. So that's my comment. Thank you.

MS. WALLACE: Okay. McClellan? Could you state your name and speak directly into the mic?

MS. McCLELLAN: Gina McClellan. I have three concerns. The lighting around the tracks that are going to be made, and I was hoping that we could be able to see some kind of visual, what this was going to look like, but for security reasons, will it become dark like the El stations down by Lake Street? That was a question.

The construction time, how long is this going to take, 2016? And then once you start, what does it do to me? Is it going to be three, four years where I'm going to be inconvenienced where I can't even get into my home since I'm right off of Halsted Street.

I'm concerned about the noise level that I will have to live with the trains going constantly. I'm concerned that the parking lot that you're going to put there, when it's filled, that I can't park on my block because I'm one block off of Halsted. So are those things being taken into consideration, too?

MS. WALLACE: Okay. Dorothy Boyd, Lou Turner, and Ben Christy.

MS. BOYD: My name is Dorothy Boyd. My concern is the families on Eggelston Street; I need to know if they're going to be relocated. We don't want to be relocated.

I want to know how the property value, how will that affect us? And I want to know about the incoming traffic that this is going to cause.

There are a lot of seniors in our area,

and we do not want to move. We already have that

train that goes down Eggelston. It keeps up a lot of noise. We need another batch of noise like we need two heads. I'm not seeing this.

MS. WALLACE: Lou Turner, Ben Christy, and John Paul Jones.

MR. TURNER: Hello. My name is Lou Turner. I'm the Public Policy Director for Developing Communities Project which is a project for the last six years.

My concern is really just singular tonight -- I spoke on Tuesday -- and that's the impact, the positive impact, the collateral benefits that this project could have for the residents in Altgeld Gardens, 130th Street, which is where the Red Line Extension would end.

Back in 2005, we did a study which showed that of all the households in this area, one out of four of these households don't have or don't own an automobile. That's the same as the 9th Ward in New Orleans; and were the same kind of catastrophe to hit, we would have the same kind of crisis of this community that we saw in New Orleans at the time of Katrina.

I think that given the history of

transportation planning, in big cities like Chicago, where very often minority communities have been more the victim than the beneficiary of transportation planning, this is an opportunity and, particularly out of Altgeld Gardens, to really provide access to one of the most isolated communities in the city. This is an opportunity to use transportation planning to provide benefit rather than victimization of a minority community.

So I would ask that the Environmental Impact Statement look at the environmental impacts that would be for the residents at Altgeld Gardens; and the fact that Altgeld Gardens is an area that has high toxicity; a lot of waste sites surround the area. It is one of the highest levels of cancers in the city amongst any group of people.

And so with the construction of this Red Line Extension, it seems to me that one of the key environmental impact factors or areas of analysis should be the impact that the construction of the Red Line Extension would have on mitigating the toxic degradation out at Altgeld Gardens and the opportunities that would provide for a very isolated community.

So, again, I urge that CTA really focus singularly on Altgeld Gardens and really push the LPA, the Locally Preferred Alternative, which is the one that would go to 130th Street. None of the impacts that are mentioned here, a number that others can think of were mentioned, would really be mitigated by the other alternatives. Only the alternatives, the LPA going down to 130th Street near Altgeld Gardens would really impact favorably these communities in these areas. Thank you.

MS. WALLACE: Ben Christy, then John Paul Jones, then Donald Miller.

MR. CHRISTY: Yes. I'm Ben Christy. I don't live in the area. Instead, I use the Red Line to get to the area. In fact, I didn't go to the other impact study because I couldn't -- you know, I'm sure there's a bus that gets by there; but 95th, 95th station, what bus to use and everything, I just didn't do it. So that's why I'm here today instead of Tuesday.

I actually do live right next to the Red Line by Berwyn. Come on by and say hi. The noise of the train, hey, it's a train. When I grew up, I lived a block away from the train. Now I

live just across the alley from a train. Yes, it's a noise. You get used to it. So don't worry too much about that.

The thing I'm worried about is the TV reception every time a train goes by. With this new better TV? No way. Anyway, that has no effect with this group.

What I see on the alternatives here is

that there are people in the Halsted area that don't want their train down Halsted; but, if I wanted to get to Halsted there, I would use the train to get to your businesses.

The plan -- the LPA, which is not the Halsted, does have the positive that it could help bring people in from out of state if we have enough parking, park-and-ride spaces. So I would expect you to decide how many park-and-rides you want and then triple it.

Other than that, we need more trains. For years, we've needed more trains. Some people will be discomforted by the building of them, but don't let that keep us from plowing ahead. They have said for years that they expected to extend this, but they haven't.

MS. WALLACE: 30 seconds.

MR. CHRISTY: So please give us -- give us our ride, extend it as much as possible. Thank you.

MS. WALLACE: John Paul Jones, and Donald Miller, and Thomas Jundanian.

MR. JONES: I'm John Paul Jones. I'm an organizer for the far south region, also a resident in the Englewood District. For 50 years, I've been involved in organizing and urban planning, and I have seen a significant value in the Union Pacific Railroad corridor. And if you look at the far south region, they have always had a challenge of public and private -- the investment. That Union Pacific corridor provides a venue where you can begin to introduce to the community, a very urban community, a whole new set of ideas and investment around transit and developing that and turn that corridor, provide venues so that the end of the station can add value to the property, at the same time, give greater access to the greater part of Chicago.

Also, from Englewood, we've always had challenges with getting transportation to jobs; and with the Union Pacific Railroad corridor, again,

you can begin to hire a lot more people, connect with the south suburban communities that are going to have job growth, much more than you get in Chicago during the economic downturn.

But, also, the environmental impact piece that we're concerned about and want to speak to tonight, that corridor, much like rail corridors throughout my community of Englewood, areas where there's always a decline of public investment and through the years you had accumulation of blight, if you look at that corridor, you look at a corridor that is over ran with many forestries now. There's open space that's been denied any real attention for many, many decades.

So it's an opportunity for you, the city and the community, to kind of think through how do we use these corridors more wisely and strategically to improve our community, encourage reinvestment, and increase the travel time for us to get to work or recreation and other venues.

So it's a real plus for the region more than a negative. I would want to encourage that more -- supporting what the person said from 95th Street corridor. Certainly, we want to be

careful and considerate of the residential impacts. We want to be very careful of the impact to the brown field districts, but also opportune as possible relative to the eroding issues. We certainly want to be helping the community anticipate and remediate any particular eroding problems that may occur in some of these wooded areas that have been neglected for 30 or 40 years.

So we want to use that opportunity to work more closely with any governmental plan to figure out ways to impact the environmental impact on the roads maybe through this reconstruction strategy. Thank you.

MS. WALLACE: Donald Miller, Thomas Jundanian, and Lori Baldwin.

MR. MILLER: Thank you. My name is Donald Miller. I heard a lot of complaints -- concerns, rather, about the environment and the noise and how the train would sound coming through the communities. But this is dealing with rail. I think we should take a model from some of the rails that run on the north side. You know, you are going to have these type of problems.

What we are trying to do is get a system

that would fit our community, that would be accessible for us to get in and out of our community efficiently and safely. And I would think the transit people should look at the highest concentration of the population, where could -- the highest volume of population and let the train be used in that corridor, in that area where the population would be affected the most.

And I think it's an excellent idea because the south side of Chicago needs a little bit more of a public system in our community, and I'm for it, and I hope that it happens very soon. Thank you.

MS. WALLACE: Thomas Jundanian, Lori Baldwin, and then Bradena Thomas.

MR. JUNDANIAN: Good evening. My name is Thomas Keith Jundanian. I'm the third generation owner/operator of an 85-year-old Roseland-based business. I'm a Roseland boy, born and raised.

I have a different perspective on this than maybe some, having grown up in this community and having our family business based here all the time, all those years. I'm not 85, but -- don't rush me.

On the heels of Donald's comments, I too kind of feel like the south side of the city has been a very neglected location in our beautiful metropolis, and it would be -- I think either one of these plans are going to be a positive thing for us. I'm not qualified to say which one is going to be better than the other.

Initially, I was surprised to find out that the LPA was the preferred alternative with more public support because it seems that it's going to disrupt some lives, some memories, some households if it occurs on the east side of the tracks. If it's on the west side of the tracks, I know from my own childhood and playing in some of those empty lots, there's more industry over there.

My business is located on Halsted Street at 116th Street. It's the K. A. Pridjian rug store, that big old rug store there on Halsted Street. So one of the concerns that I would have as a business owner having seen long construction projects mean the demise of some businesses that have been interrupted with their traffic flow.

What have previous construction projects like this and studies that have gone on indicated with those businesses? How are they impacted? I have got nothing to base this on. When this trestle goes up on Halsted Street, what is it going to look like? It's probably going to be concrete. Jack and I were talking outside. Would it be something that's attractive? Will the elevated tracks all the way down Halsted Street create a lot of dark shadows, a lot of shadowing areas where people can congregate and do things that are not in the best interest of the community? Will the trestle be placed where garbage and other debris and litter accumulate? Will it be a blight to Halsted Street?

As far as bringing people down Halsted Street, yeah, it will. The stations are going to be -- you know, 111th and 119th are a mile apart. So that's still quite a ways to try to get to one of the businesses. I was chatting with a lady who also has a building at 108th and Halsted. That kind of encapsulates some of my concerns. I think either one of these things are a positive thing for the south side, whichever is best for our city and our community. Thank you.

MS. WALLACE: Lori Baldwin, and then

Bradena Thomas, and JoAnne Guillemette.

MS. BALDWIN: I am Lori Baldwin, and I'm representing the West Chatham community and the Park Advisory Council of that area, but I'm also part of the Red Line Oversight Committee.

I would just like to interject that I'm thanking the FTA for requiring this public hearing as well as CTA for selecting the Union Pacific Railroad as the locally preferred route, particularly, because this route will give the greatest need and take care of a lot of the needs of disparity that we have had in that community for a very, very long time on the south side of Chicago, to give us more transportation options; as well as we have had the opportunity on September 18th, some of the members of DCP Red Line Oversight Committee toured the entire Union Pacific Railroad, and we examined the physical and environmental conditions and the impact along the corridor, and we found that there are documented parkways, homes, small businesses, and tracks of forestry along that route.

However, most of that route, as has been stated before, is open space, and so this would be

a great asset to the community. Also, because of the need for us to have transportation in this area, and it's been such a long, long time, this is the area that I think the city should be focusing on much more than some of the other options.

We also looked at the environmental impact, and this provided greater access to a number of residents. And also this route had less environmental impacts in terms of conditions and areas and the taking of homes.

So I, again, just want to encourage you and let you know that the community will benefit from this new development. Thank you.

MS. WALLACE: Bradena Thomas and then JoAnne Guillemette.

MS. THOMAS: My name is Bradena Thomas. I am concerned as a senior living in the area. In fact, I'm right at 97th and LaSalle which is where 94 and 57 split.

My concern is whether or not there would be an elevated track right behind me or whether it's going to be recessed?

Also I have a business, a building on Halsted at 108th. Now is this going to be an

elevated structure which would darken, you know, the area? So that is my concern for both. But I definitely wouldn't want an elevated area looking out of my backyard. That's my concern.

They do need transportation to the south because 95th is extremely congested, and I realize that; but, hopefully, I wouldn't want to have to move. Thank you.

MS. WALLACE: JoAnne Guillemette.

MS. GUILLEMETTE: Good evening. My concerns have been previously stated by several others, but to say it as succinctly as possible, my concern would be for the increased foot and vehicle traffic; the increased debris; as well as the increased crimes that would follow a structure like this.

I have lived near the Red Line and I know that it also -- because of the activity and vibration of the ground, it increases the presence of termites and other rodents. And when you're dealing with termites, you're talking about the destruction of homes; and, to prevent it, homeowners would incur tremendous expense on a yearly basis to ward off the termites. So that's

an extreme concern for me. And I would hold that for other homeowners as well.

Further, who would bear the maintenance expense of this extension? Because the homeowners nearest the tracks, are their property taxes going to increase? Is their property value going to go down? And what mechanisms are being put in place to address these issues? Because it's my feeling that you're going to go ahead with this in spite of what we say. And especially if we should be successful with our bid for the Olympics, this is going to be a major development. It's going to be pressed forward, and the residents need to know the true impact on them in terms of dollars and cents. Thank you.

MS. WALLACE: Could you please restate your name for the record?

MS. GUILLEMETTE: JoAnne Guillemette.

MS. WALLACE: Thank you. Are there any other speaker cards? Gwendolyn Rice and then Barry Finkel.

MS. RICE: My name is Gwendolyn Rice, and I work for Developing Communities Project which has been working with this issue for six years.

MS. WALLACE: Could you get little closer to the mic, please? Thank you.

MS. RICE: But I think I'm coming from a more personal point of view, because all the other issues have been talked about.

For the last I won't say how many years of my working life, I have worked in one way or another with residents of Altgeld Gardens as a counselor or as a recreation worker or just simply knowing children who live there or adults who live there. And I remember and I just -- my mind was refreshed on the way in when one of the workers outside mentioned that she had lived in Altgeld Gardens and she remembered having to take the PACE bus into Chicago and then taking a CTA bus and then finally getting to the Red Line.

But I remember also having to take kids home at night because the transportation was not available for the kids to take advantage of the amenities in Chicago. I remember many times having to do that, even in the afternoon having to do that, which I didn't mind doing because I could do it. But their parents may not have always been able to do that, provide the access.

This project is going to provide access to what is a transit disadvantaged community. We are kind of in competition with other lines throughout Chicago that are going beyond the city limits. On the south side, there's nothing that goes to the city limits. And I really say that we must take that Locally Preferred Alternative through to 130th Street. I don't think there's an alternative. That's the only option.

I don't know what else to say, but I just am passionate about the fact that you're going to Altgeld Gardens, an isolated community that is not outside of Chicago. It is in the Riverdale community area of Chicago -- not in Riverdale, Illinois -- and it's important that the CTA go at least to the city limits to serve its constituents. It will also serve people who live in the suburbs who commute to Chicago who will have a chance to park and ride and ride downtown and eliminate a lot of pollution.

Again, I just want to speak on behalf of the residents of Altgeld. I don't live there, but I have been there many times. I have worked there, and it can make a big difference in providing an opportunity for people to have access, to be able to be exposed to the larger community. As the teacher said earlier, people generally who live in transit deserts do not get out and understand what's going, and it would cut down on violence and cut down on a lot of other factors. Thank you.

MS. WALLACE: Thank you. Barry Finkel. If there is anybody else who wishes to speak, send your speaker card in.

MR. FINKEL: My name is Barry Finkel. I have been a resident of the Beverly area, 103rd and Western, since 1951, and I take the Red Line downtown at least once a week. I see at 95th Street station lots of PACE buses coming in from the south suburbs, and I think an extension of the Red Line would help in getting those buses -- to get the train and not have to come all the way to 95th Street to service those people.

We're talking here about public transportation, and I see in all the alternatives, there's talk of park-and-ride. It seems to me, and I have sort of a disagreement with some of the speakers, but it seems to me that if we have good feeder bus lines into the stations, there's no need

to have a large park-and-ride facility at each station. Maybe at the farthest station. But I don't see really a need, for example, a big park-and-ride station at 103rd and Halsted. There's no room there for a park-and-ride, and I don't see any need for it. Thank you.

MS. WALLACE: Alice Harper-Jones.

REV. HARPER-JONES: Good afternoon. I am Reverend Alice Harper Jones. I'm the Dean of Cluster 6 of Chicago Metropolitan Association of the United Church of Christ and represent about 13 churches on the south side. And I'm also a member of the Chicago State University Alumni Board, and so I'm speaking, commenting on two things.

The first one is our churches. There are people who live on the far south side who will have better access to the church, being able to get there and to get back home again, especially those who do not have cars or sometimes you wake up and the car is not working. So I think that would be positive for those people.

Also, from Chicago State University. I'm thinking in terms of our academic program that we

have there, it would be better accessible to many, many people; and those young people that we're trying to attract to the university would certainly be able to have access to and from the university. Especially if a person is working, they can come in the evening to attend the university and be able to go back home again without having to, you know, wait for buses and everything on 95th Street because Chicago State is very accessible to 95th Street right there.

My concern is that -- one of the proposals I looked at, the Halsted Street would still -- there's still a gap it seems like from Halsted Street all the way to the Altgeld Garden projects there. So in constructing, you know, that Halsted Street project -- and I'm kind of leaning toward Halsted because you're not destroying homes. But if you can, you know, think in terms of your construction of getting that closer to the people in the project, then they don't have to take a bus from Halsted to where their home is so that they would be able to have access to the university and to the churches.

Again, as I say, I prefer the Halsted one

because then we're not destroying homes. People have lived in this community -- I live in the community. I know the value of my home, and I don't believe that if you give me fair value that it will be -- you know, it would really come to where I think that my home should be priced at because of the improvements I have made.

So that should be a consideration especially when we think about seniors who have been there for years and who take pride in their home and their neighborhoods and their friends around there, that to destroy that community, you know, with the train is not a preferred option. Thank you.

MS. WALLACE: William Warren. Please restate your name.

MR. WARREN: Good evening. It's William Warren, W-a-r-r-e-n. I'm here representing the Vernon Park Community Council. I'm president of the Vernon Park Community Council. We live in the area as well. I'm also a member of the Oversight Committee who had the opportunity to do a tour of the actual site last week -- actually, this week.

And, you know, we feel that by all means that the Red Line should be extended to the south side. We're in support of it. We think it would be a positive move in every respect. A lot of comments that were made earlier in reference to the rodent issues, the way the tracks are going to look, the lighting issues, the garbage and that sort of thing, of course, we're very concerned about those issues, but we feel very in support of bringing this extension to the south side. Thank you very much.

MS. WALLACE: Are there other speakers? Okay.

Again, we're going to be here until

8 o'clock if others arrive and still want to speak. I did want to mention that scoping comments are due by October 27th. So in addition to speaking tonight, you have an opportunity to write comments and place it in the box outside. You have an opportunity to mail in comments, fax or e-mail your comments. And we'll make sure this is back up for your reference.

We also encourage you to stay involved. You can visit this Web site. You can also get on an e-mail list so that you can receive updates

through e-mail and through Darud, if you'll e-mail him.

Any other comments at this time? Have you filled out a card, sir? Right now, we're taking public comment. If you want to fill out a speaker card and come to the mic --

MR. TURNER: I did.

MS. WALLACE: Well, three minutes is the rule. Are there others that want to speak?

We'll stick around. You are welcome to spend some more time out at the boards if you like or you are welcome to head on out, but we'll be here until 8 o'clock.

(Off the record at 7:34 p.m.)

(On the record at 7:46 p.m.)

MS. WALLACE: Johnnie Burke. Please restate your name and speak directly into the mic.

MS. BURKE: Johnnie Burke, and I'm a member of the 96th and Prairie Block Club. I had two questions. One, how many residences would be disturbed with the park-and-ride construction? And also, in the entire project, how many residences would be destroyed? How many people would be removed from the community? Thank you.

(Whereupon, there were no further speakers.)

As a 30 year southside resident I welcome the proposed extension of the Dan Ryan branch of the Redline. The Union Pacific corridor is the best route. The extension would enhance the neighborhoods it runs through, ease traffic congestion and give better transit options to user of CTA buses, Pace, Metra, and South Shore trains.

Mr. Jeffrey Busby,

Attached is the One-Way Loop alternate proposal that I recommended to the CTA at the public hearing on Tuesday night. Let me know if you have any questions.

David May

CTA Red Line

David May: 9-27-09

Extension South of 95th St.

DESIGN CRITERIA

1. Maximize number of stations within walking distance of customers homes to provide many one-seat trips. *Therefore*:
   a. Locate stations at ~1.0 mi on center
   b. Locate stations within or adjacent to residential neighborhoods

2. Provide convenient rail transit access to those without, by avoiding overlapping coverage with existing Metra stations. So focus the routing east of I-57, north of 119th St. and west of King Drive.

3. Minimize property acquisition costs, construction costs, grade separation structures and noise in quiet neighborhoods by maximizing the use existing vacant and excess transportation rights-of-way.

4. To control construction costs, run the line at grade (on ground) as much as possible.

5. Serve Chicago State University and Olive Harvey College.

Red Line Extension

David May 9-27-09

Proposed One-Way Loop Alternate

After considering several options, the CTA narrowed its study of Red Line Extension designs to 3 possibilities: two heavy rail and one BRT. All three were 2-way, north-south lines running south to 127th or 130th Streets. Both of the heavy rail line extensions had only 4 stations. The CTA selected the UPRR heavy rail extension alternative (designated the Locally Preferred Alternative = LPA).

I believe CTA made a mistake in considering only two-way linear extension options and in selecting the UPRR line. The study should have also considered one or more one-way loop extensions of the existing heavy rail system. A one-way loop at the end of an existing two-way mainline offers many advantages over a two-way linear extension. Compared to a two-way line of the same length with the same number of added stations, some one-way loop extension trips take longer; but others are quicker. The one-way loop requires half as much track as the same length two-way line, allows single side stations with no crossover structures, can use narrower (and, in this case, often existing) rights of way, requires narrower and less expensive elevated guideway structures, requires fewer train cars, fewer train operators and consumes less electric power.

Attached is proposal for a 10.0 mile long single track one-way loop Red Line Extension with 7 stations spaced about 1 mile apart. To better serve Washington Heights, Roseland and Pullman neighborhoods that lack rail transit service, the entire loop is located more than ½ mile north of the Metra Electric Line's 4 stations on 121st St. Compared to the CTA's preferred 4 station, two-way, 5.3 mile long extension(LPA), this proposed one-way loop extension is conveniently accessible by walking to 50% more local residents. The one-way loop extension has lower construction costs of elevated structures and bridges, more use of existing public rights-of-way, less track rail to purchase, much less expensive costs per station, and similar traction power distribution costs.

The proposed 10.0 mile one-way loop route will have low right-of-way acquisition costs because:

> 1.9 miles are located in the median of the Bishop Ford Expressway
> 2.5 miles are located in the median of I-57
> 1.1 miles are located on an abandoned railroad right-of-way
> 2.9 miles are located on unused railroad right-of-way next to existing freight train tracks.

Combined, these comprise 83% of the required rights-of-way.

Over three quarters of the proposed 10.0 mile one-way loop route is at grade to substantially reduce guideway and stations construction costs. Six of the seven stations are at grade. Only three of the seven stations require stairs and elevators. All seven stations are single side platform – reducing the area required, the cost of construction and the need for cross-over structures.

CTA Red Line David May: 9-27-09

Extension South of 95th St.

MAP DESCRIPTION

1. Proposed One-Way Loop Route is the Green line. Stations are Green ovals. Green circles are ½ mile radius from Green stations.

2. CTA UPRR Locally Preferred Alternate route is the Brown line. (South end and station at 130th Street are not shown.) Stations are Brown ovals. Brown circles are ½ mile radius from Brown stations.

3. Metra Electric line stations are Blue circles.

Red Line Extension
One-way Loop Proposal

Station	Route	Route Distance	Direct Distance	At Grade	Elevated	Elevated Structure	ROW status	ROW notes	Station Elevated?		Station components

Subject: Red Line Extension Comment

To whom it may concern:

I really like the idea of extending the Red Line South. It should greatly improve the transit options sor the far South Side. However, it seems very strange to have an alignment that crosses over the Metra Electric and South Shore lines but does not provide for convenient transfer between those lines and the Red Line.

A much better option in terms of improving overall connectivity in the transit system would be an alignment that left the UP right-of-way at either 115th St or Kensington Ave, traveling east to the Metra Electric line, crossing over the Metra Electric line and turning south onto the IHB right-of-way. A Red Line station on either Kensington or 115th could provide a relatively easy connection to Metra and the South Shore.

If such an alignment is not feasible, the CTA should work with Metra and/or the South Shore to establish a convenient transfer station somewhere for the Red Line extension.

Thank you,

Mark Ambrose

Ladies & Gentlemen:

I thought that if I could sell the idea of a Boston style High Speed Electric Trolley Bus (Articulated) running parallel to the Norfolk and Western railroad tracks that the Red Line Extension could be built and operational much faster, and at a substantially lower cost than a Conventional Fixed Rail system.

I was told that modifying Eggleston Avenue to take high speed buses would've been so cost prohibitive that it would've been better to go conventional anyway. I liked South Halsted Street better, but I've learned that it too, has been passed over.

The Green Line's Kenwood Corridor uses alleys to the east of Prairie Avenue. I was therefore wondering why alleys to the east of South State Street or South Michigan Avenue were not considered.

There has to be a cheaper, faster means of putting the Red Line Extension together and making it operational.

Subject: Red Line Extension

It's about time that the CTA is finally considering seriously an extension to the Red Line from 95th St. As you know, the far south is the **only** area is the Chicagoland area that is not served by rapid transit. The South Side of town for some reason is almost always ignored when it comes to either new service or improvements to service.

This is something that has been talked about for at least the past 25-30 years and I hope that the political hoops and ladders that have to be cleared don't get in the way of making this project happen, at least I would like to see it happen in my lifetime. The problem with the rest of the Red Line is there is no parking facilities to serve riders. I have been in other cities and many of the stations have very adequate parking. I believe that it is the key to growing ridership. I have parked at quite a few of the stations on this system and I have noticed that there is parking available after the morning rush hour. When you double the price of parking from $2.00 to $4.00, this would make an impact. People are suffering enough with loss of income and rising prices. Now, it is cheaper to drive to your destinations rather than ride your system which is at best slow.

Good Morning,

I do think that the Red Line expansion is in dire need. There are many people who travel long hours to reach the city for work, etc. I do believe the Red Line expansion along the Union Pacific to be a good route. However, with the expansion will added bus services be included? I ask due to the fact that I live far East and there is no night owl services to 130th. Please take in consideration if this does take place to include night owl services along the far East side/Hegwish area. The expansion would be a positive project for all that take public transportation on the far South side of Chicago.

Thank You,
Melissa Najera

DEAR MR. BUSBY,

RE: REDLINE PROPOSED EXTENSION TO 130TH STREET

I AM INTERESTED IN FURTHER INFORMATION ABOUT THE CTA RED LINE PROPOSED EXTENSION.

ANY SUCH IMPROVEMENT IS LONG OVERDUE AND SHOULD CERTAINLY MEET WITH APPROVAL FROM SOUTH SUBURBAN RESIDENTS. SOUTH EASTERN RIDERS ARE MOST IN NEED OF THIS EXTENSION.

METRA RAILROAD TRAINS MANAGERS MAY NOT LIKE THIS IDEA, BUT NOT ALL REGULAR COMUTERS PURCHASE MONTHLY PASSES.

I WELCOME A WRITTEN REPLY, AS I HAVE NO HOME COMPUTER. (BUT I WOULD LIKE TO KNOW MORE ABOUT COSTS, NEED, AND WHAT PROPOSED ALTERNATIVES ARE DECIDED UPON... SUBWAY CTA COSTS ARE A MAJOR FACTOR FOR RIDERS: MANY HAVE LIMITED INCOMES AND BUDGETS. WHILE METRA IS COMPETITION, RIDERS LIKE AS MANY CHOICES POSSIBLE. SOME SUBURBS ARE NOT WELL SERVED BY METRA LOCATIONS, SO RIDERS ARE FORCED TO THE ONLY OTHER CHOICE.)

THERE MUST BE MANY OTHER FACTORS

WHICH THE STUDY WILL UNCOVER, AND THE PUBLIC NEEDS TO KNOW THEM ALL.

P.S. WHEN A THIRD AIRPORT WAS FELT NEEDED IN THE AREA, HOWLS OF PROTEST ERUPTED. MAYOR DALEY DID "MIDNIGHT-BEHIND-THE-SCENES LAKE-FRONT-INTERFERENCE" TO BLOCK SUCH A PLAN NEAR McCORMICK PLACE. IT NEVER DID GET ANY VOTE OR EVEN GET TO CHICAGO'S CITY COUNSEL MEMBERSHIP FOR THEIR INPUT. (HOW DID THAT BENEFIT "THE CITY THAT WORKS"??) SHAME ON SUCH POLITICAL MONKEY SHINES! RIDERS INPUT SHOULD NOT BE IGNORED.

YOUR REPLY IS WELCOME!

THE IMPACT (REAL NOT POTENTIAL) IS THE NOISE CREATED BY THE TRAINS. MORE PRECISLE~~Y~~ (PRICISELY) IT MAY NOT BE THE NOISE OF THE CTA TRAIN BY ITSELF BUT WHEN ADDED TO THE NOISE THE UNION PACIFIC RAILROAD MAKES WITH THE "OVER USE OF THEIR HORNS" WOULD MAKE THE COMBINED NOISE TOO MUCH TO TOLERATE. I UNDERSTAND TRAINS ON TRACKS MAKES NOISE BUT THE UPRR HORNS ARE TOO MUCH

ALSO, AS SOMEONE SAID TONIGHT WHAT ABOUT TERMITES + OTHER RODENTS DISPLACED AND LOOKING FOR SOMEWHERE TO LIVE (MY HOUSE MAYBE!)

RS-16

Oct. 2, 09

Hi Jeffrey,

I see you are the travelers friend - you asked for our input.

I live in N.W. Indiana and have a difficult time getting to Chicago since the pace #355 Lansing to Chicago Loop was eliminated. From the Schererville - Munster border I ~~can~~ could safely and easily drive to Ridge and Wentworth - get on #355 and arrive at the Loop - No-longer! I don't care to take the South Shore. The station has minimum SAFE parking and I must drive through a questionable area where there are now gang shootings and a few murders. With your new schedules and extensions can this 80-year old former flapper extend her comments. Please!

1. Extend one of the electric rail routes to connect with a possible Indiana Illinois border parking lot.

2. Reinstitute # 355

But on a reduced schedule to allow working people as well as shoppers and hospital patients early in the day and return late afternoon rides on a safe and easy to get to bus.

But eliminate the costly empty mid-day routes. I had ridden near empty busses and I sympathize with your low revenue. But a good schedule could be a better source of revenue to you.

Sincerely, Lorraine Smalley

First of all, I would like to apologize for sending this in late, but someone else attended the meeting for me, but did not tell me their was A date for submission on it. I recieved the materials late and the information. I decided to send the card in anyway and keep a copy of it. According to some of the speakers at the meeting this project has been on the table and introduced in the 1960's. Now they talked about the completion date and the enviromental survey. Impact the dates or years 2013-2016 and govermental funding and being in compliance with. I heard of some of the major and minor concerns too, Businesses, residential and non residential. As far as an environmental impact study being done this is not A new project, that has

No existence. This is a project that has a as you used an extension. Therefore it is already in existence. And environmental studies from the previous years should assist instead of creating new ones. Its far as the 130th stop you have already environmental issues ~~sta~~ such as waste and industrial companies in that area. Those people who had concerns about their businesses, that have financial statements prepared each year and according to the economy, if the construction is going to affect them ask to be compensated for their losses. The residents should go to their local real estate agencies to find out or to other areas to find out if their property has depreciated or appresiated. What I was looking for is some ~~tem~~ solutions that could be offered while the concerns exist. The timeframe that they are talked about is unreasonable for something that already exist. Also certain people talked about the beneficial factors and assisting young people of getting around better and for those who do not have cars. Another comment was made about the disparity in certain communities that are minorities and the way they have been overlooked. I thank you for your time and effort in reading this comment letter. Last but not least one gentlemen said he lived by the train and the noise is not so bad and it would free up the congestion at 95th Dan Ryan.

Thank You Annette Spight

The design of the 115th Street/ Michigan Ave Station is of special interest because it is at a location that can significantly develop. Development should not be hindered at this location by a bus turnaround. Furthermore, this may not be a good place for a park and ride either. This space should be used for commercial retail and/or a community focused service.

Subject: Illinois State Police concerns

As we discussed in the Scoping meeting on September 23, 2009. Below is details a few concerns we had and would like them looked at during the preliminary phase:

FIRST RESPONDERS

Will the construction area be easily accessible for First Responders to respond to any type of emergency? With the tracks being elevated, will there be an easy on/off for personnel?

SECURITY

If the Contractor desires additional police officer services of Illinois State Police (ISP), District Chicago, for enforcement, traffic control, and/or security, ISP personnel will, as available, provide police services on a hireback basis. During this time, ISP officers will provide a visible State Police presence, provide general police services and take enforcement action as appropriate in and around the site of the program. We will govern all areas on the expressways or on state owned property. To secure the above, the Contractor would have to sign a binding contract detailing all the specifics with the State of Illinois.

If you should have any questions or need additional information, please do not hesitate to contact me.

Respectfully,

Lieutenant Tony Lupo

As a resident of the South Side of Chicago for over 30 years the proposed extension of the Red Line is long overdue.

It will alleviate congestion, make travel faster for bus users and give better transit alternatives to people who live on the far South Side of

Chicago and Northwest Indiana. The Union Pacific route makes the most sense.

Aristotle Haywood.

CONNECTING 95TH STREET STATION TO 130TH STREET"
September 22, 2009

STENOGRAPHIC REPORT OF PROCEEDINGS had in the above-entitled matter held at the Historic Pullman Visitor Center, 11141 South Cottage Grove Avenue, Chicago, Illinois, commencing at 6:44 o'clock p.m.

PRESENTERS:
MR. DARUD AKBAR, Government & Community Relations Officer, Chicago Transit Authority
MR. JEFFREY BUSBY, General Manager, Strategic Planning, Chicago Transit Authority
MS. SARAH LAYTON WALLACE, Moderator

Reported by: Anna M. Morales, CSR, RMR
License No.: 084-002854

(Whereupon, the following proceedings commenced at

6:44 o'clock p.m.)

MR. AKBAR: Good evening, everyone. If we could have folks begin to take their seats, we would like to go ahead and get the presentation started.

Good evening. Once again, my name is Darud Akbar. I'm the Government & Community Relations Officer with the Chicago Transit Authority. I would like to welcome everyone to the CTA's public scoping meeting for the Red Line Extension Project. Before we begin the presentation, I would like to acknowledge Lorie Lipson. She is representing Alderman Austin's office. If you could just raise your hand, Lorie. Thank you.

I'm going to turn things over to Sarah. Sarah is going to give us a talk about the meeting agenda tonight, and then we're going to go ahead and begin the presentation shortly.

MS. WALLACE: Thank you. Before we get started, I just want to check, is there anyone that will be in need of Spanish translation this

evening? We do have that service available.

Tonight, as you see our agenda, we are just completed with the open house portion of the agenda, and now we're going to move into the presentation that's going to be about a ten-minute presentation, and Jeff Busby from CTA is going to make that presentation to you, after which we'll move to our public comment period. And just before the public comment period, I'm going to go through some guidelines with you so that you have an understanding of how that process works and your time limitations and so forth that you have.

At the conclusion of the public comment period -- and I will just say that if it's not 8 o'clock yet and we've gotten all the comments initially, we are going to remain here to take public comment until 8 o'clock as we gave you notice, and then we'll just go over some next steps before we adjourn the meeting.

So with that, let's turn it over to Jeff for a presentation.

MR. BUSBY: Hi. Thanks, Sarah. Thanks all for coming out.

I'm Jeff Busby. I work in the Planning

Department at CTA. I see quite a few familiar faces from our previous work.

Just a little bit of background on the Red Line Extension Project. The idea to extend the Red Line has really been around since the 1970s; but we, at CTA, got very busy with the first and foremost stage of a federal process to begin to apply for money back in 2006 when we started an Alternatives Analysis study.

The purpose of that study was to look at a whole range of transportation options to improve the service in the study area to the far south side and the south suburbs. We looked at different transit technologies or modes, different corridors, different profiles where the transit would be in relationship to the street level.

We had three rounds of public outreach. Very strong attendance at all of those. We had some really nice media coverage.

Recently, in August, we concluded that study when the Board of the CTA adopted the Union Pacific Railroad Alternative as the Locally Preferred Alternative. That will be one of the alternatives we'll look at in the environmental

studies. I will talk a little bit about that in more detail. But this environmental study which we're starting right now really is a culmination -- it starts from the work we did in the Alternatives Analysis and advances that into significantly more detail.

Why are we doing this? Well, we would like to use federal funds, at least a portion of the federal funds, to help pay for an extension to the Red Line. To spend large amounts of federal money on really anything, you need to comply with the National Environmental Policy Act which requires that you identify potential impacts both positive and negative to the environment from the construction and operation of a rapid transit facility. So we're starting that process tonight.

The purpose of preparing this document is both to inform members of the public about the likely impacts, but to also help decision-makers who will pay for and be responsible for operating the line about the impacts and how we might mitigate those impacts that are adverse to the community.

Here's a schedule for you, just to give

you a sense of where the project is and where we would like to go. This is a target. It's not something that unfortunately I can guarantee for you. But we're going to start this evening receiving your comments on what you would like us to study in the environmental review. We're going to study that over the next year and share a draft of the Environmental Impact Study at the end of 2010 or perhaps early 2011.

At that stage, we need to ask the federal government for additional money and for permission to begin final design. That's the preparation of really the construction drawings. We hope for that period to last between 2011 and 2013. At that point, we need to have identified all the funds for the start of construction. If those funds were available and, again, if we got federal permission, we would like to start construction in 2013 to open in 2016.

I think this is a realistic schedule. It is ambitious. Certainly your support is helpful in making that realized. I mentioned that we'll be studying the Locally Preferred Alternative which came out of the Alternative Analysis Study; but

there are also three alternatives that will be studied as part of the Environmental Impact Study.

The first is a No-Build Alternative. That becomes a point of comparison, so what would be the environmental impacts of not doing anything.

The second is a Transportation System Management Alternative. It's a long word, but what it really means is a lower cost alternative to building the Red Line; and, in this case, it would be express buses and some improvements at 95th Street so that those express buses could have a place to drop people off.

The Locally Preferred Alternative, there are maps in the back and we'll be talking about that in more detail. That's an extension of the Red Line from 95th Street following the Union Pacific Railway with stations at 103rd, 111th, 115th and Michigan, and a final station at 130th. It's an elevated extension, so it's above the street level but adjacent to those Union Pacific freight tracks.

And, finally, another alternative in the

Alternatives Analysis that performed very well that we thought we would include in the environmental

study as a point of comparison was an elevated extension along Halsted Street. It would be elevated above the median of that street. Similar, four stations at 103rd, 111th, 119th, and 127th and Vermont.

This is a map of the Locally Preferred Alternative. As I mentioned, it leaves 95th Street, travels in the median of I-57, and then is an elevated line above the street level traveling next to the Union Pacific Railroad. It ends at 130th and the Bishop Ford, very close to Altgeld Gardens.

And, similarly, the Halsted alternative which leaves 95th Street, again using the median of I-57, travels south elevated above Halsted, ending at 127th.

So we're very interested in your comments tonight. Sarah is going to help us with rules on how that's all going to work and I will turn it over to her.

MS. WALLACE: Okay. Thank you very much. So it's time for the public comment process, and I want to go over some of the guidelines.

First of all, so that you know, we would like you to focus your comments on the work that we have ahead, which is the purpose and need for the project; the proposed alternatives; the proposed environmental issues to be examined; and the potential environmental effects and mitigation measures to be considered. So those should be the focus of your comments tonight.

The guidelines. If you would like to speak and if you haven't done so already, you will need to fill out one of these speaker cards. Christy will be happy to collect those and bring them to me. I will plan to call speakers up in the order that I have received them. And I will call a couple at a time so that you can go ahead and get lined up and know where you're coming.

When you come to the microphone, I'd ask you first to restate your name so we get that for the record. We have a court reporter here who's going to be documenting your comments. And we would ask you to direct your comments to CTA here at the front table.

You're going to have three minutes to comment. And the good news is you're not going to have to keep track of the three minutes. We got a

stoplight here so everyone can see that. When you begin your comments, the stoplight will be green. When you have got about 30 seconds left, the stoplight will turn yellow; and then it will begin flashing when you have 15 seconds. So you should be able to gauge your comments and know when you need to be wrapping up. Once that turns red, that means your comment time is up.

We would ask everybody to stick with that comment period. The only exception to that is anyone who needs translation, we're going to allow six minutes because of the time that it takes to go back and forth with the translator. So be aware of that.

Tonight, we're really here to hear what you have to say. This is your chance for input on the process. CTA is here to listen to you. And so they won't be responding to your comments in any way at this time, but your comments are going to be documented in a scoping report.

So that's the process. Hope that's clear to one and all, and we're ready to get started.

Okay. We have -- the first couple are Helen Rockingham, Derrick Brownlee, and Reverend

Isaac Hayes. You want to get situated at the microphone. And, Helen, please go ahead and restate your name first.

MS. ROCKINGHAM: My name is Helen Rockingham. I would like to say good afternoon to everyone. I would also like to give my appreciation to CTA -- express my appreciation to CTA for this effort.

It's been long past due, and there are a lot of residents who are going to appreciate having this kind of facility available to them.

Myself, I'm a rider on CTA's Red Line train and buses at some point in time to work everyday. And what I find at 95th Street is that the parking is nonexistent and we're always getting traffic tickets there. So these lines and the proposed parking spaces that would be available at the different terminals would be a plus for this project to us, to the community, and we appreciate that, if the project becomes finalized.

Another thing is I'm a property owner and that Pacific line comes right past my home. As a matter of fact, I'm the second house from that line, south of that line on Princeton. And the environmental impact, I know for the benefit of the

community, if we have to be relocated, that would not be an issue to some homeowners, but CTA's obligation to us, when will we find that out or if it would be found out in the 2013 year, and how would those -- how would those homeowners be contacted and at what point, would be my question.

Okay, I'm still on green. Great. Yes, it appears that the preferred route would be the Pacific line. I have been bouncing this, brainstorming with a lot of neighbors, and we see Halsted would be the least route for the advantages for the businesses and traffic going to the expressway. We just know we will see the benefits of it in our neighborhood, and that's the end of my comments. Thank you.

MS. WALLACE: Derrick Brownlee. Derrick Brownlee? Okay. Reverend Isaac Hayes.

REV. HAYES: Reverend Isaac Hayes, candidate for U.S. Congress in the Illinois 2nd Congressional District, and I just want to commend the CTA for taking this step. Certainly I know many residents and citizens on the south side have long wanted this, and people are happy they will have an easier commute to work or to school or wherever they may

go. And so I don't need the full three minutes. I just wanted to commend the CTA, and the residents on the south side are very happy for this step. Thank you.

MS. WALLACE: Robert Franklin and then Charlie Yale.

MR. FRANKLIN: All right. My name is Robbie Franklin. I would like to know if you're going to run the El starting at 99th and Eggelston, are you going to be on that platform on the tracks to the Pacific or are you going from the west side or the east side? And are you going to damage the little park that's in there between 99th and 103rd?

MS. WALLACE: Do you have other comments?

MR. FRANKLIN: No. That's it.

MS. WALLACE: Charlie Yale and then Eugene Taylor. Please restate your name.

MR. YALE: I'm Charlie Yale from Citizens Taking Action. I work with the unions and I got a high seniority.

It's a wonderful thing that CTA is doing right now with that extension. If the economy picks up and the recession gets better in the near future, where are you going to extend the Red Line?

How far out may I ask? How far out? The Red Line, how far out will it go out? How far in distance, north or south? May I ask, please?

MS. WALLACE: Right now we're in the public comment portion, so we're just listening to you, but that's the kind of discussion you can have as you are looking at the board.

MR. YALE: Fine. If this works out for the public and everybody else, it would be a wonderful thing. Let the economy pick up with the recession. Right now, it's pretty bad right now. If this could be done, it would be a wonderful, wonderful thing for everybody and everybody. I want to see what happens. Analyze this.

There's construction going on I heard. This I heard. But this could be done by everybody and be one good thing for the future. I want to see what happens.

MS. WALLACE: Eugene Taylor and Michael Bryant.

Eugene Taylor?

MR. TAYLOR: Yes.

MS. WALLACE: Please restate your name.

MR. TAYLOR: My name is Eugene Taylor, and I'm here to represent Developing Communities Project.

We are a faith-based community organizing agency that has served the Chicago community areas of Greater Roseland since 1986.

In 2003, DCP began organizing a transportation campaign advocating for the expansion of rapid transit on Chicago's far south side. DCP through its CTA Red Line Oversight Committee, or RLOC, comprised of community residents, churches, community leaders, and local grass root organizations initiated a referendum drive in 2004 that resulted in 38,000 votes supporting the extension of the CTA Red Line along the Union Pacific Railroad Corridor.

We have come to recognize the critical importance of mass transit to Chicago and its residents. From the increased exposure to air and noise pollution throughout the region to the increased travel time imposed upon both workers and students, addressing our mass transit service needs was and is paramount to our community's future and its quality of life. This community has paid a high price for this urban transit dilemma.

But today is a good day. This day is long awaited by many and fully expected by some,

expected because the public's desire for economic justice and equity in capital spending decision-making was reasonable. Yet, its anticipation for nearly 40 years has become an urban legend.

So, today, we thank the Federal Transportation Administration for requiring this public hearing, and we thank the CTA, the Chicago Transit Authority, for selecting the Union Pacific Rail route as the locally preferred route.

We here today want to register our initial public comments as part of the scoping process. On September 18th, 16 members of DCP's Red Line Oversight Committee toured the Union Pacific Railroad route to examine the physical and environmental conditions along the corridor.

MS. WALLACE: 30 seconds.

MR. TAYLOR: The RLOC participants documented parkways, homes, small businesses, and tracks and so forth.

Much like the Federal Transportation Agency, the DCP Red Line Oversight Committee will be listening to the CTA's environmental impact consultant's statement. Our committee will continue our review of the locally preferred route, the environmental and engineering requirements. We'll conduct and assemble additional public comments.

MS. WALLACE: Thank you.

MR. TAYLOR: And thank you.

MS. WALLACE: We look forward to written comments for those of you who have more than you can say during your three minutes. Michael Bryant.

MR. BRYANT: (Through an interpreter). Hi. My name is Michael Bryant, and I have been dreaming of this for like a long time. It's amazing how this idea is very similar to what I dreamed about. And, of course, I prefer the UPR route. You know, I prefer that very much because at 95th Street, there's really a lot of traffic there. Like I went there and I went to the other meeting and I tried to explain, but I just want to know what they're going to do for the future. I mean, we discussed like what the plans might be.

I think it's great if the 95th Street line could be set up, you know, on 130th Street, and if they could add that, that would be perfect. But I know the choice -- the decision hasn't been made.

It's a future decision, but I know it's going to be a speedy process -- I know it's not going to be a speedy process. And there's a lot of things that are going to have to change, but I think the environment will change rapidly with the changes that are going to be made by the CTA. Thank you.

MS. WALLACE: Okay. Ernest Williams and then Lou Turner. Ernest Williams?

MR. WILLIAMS: Coming. Good evening. My name is Ernest Williams, and I'm here on behalf of the Golden Gate Community Association.

The one question that I had was when the Orange Line was extended southwest to Midway, I'm sure that these same studies were done. I think it would be -- it would benefit us to talk to some of the leaders that helped implement that plan and live through the process to see what the line impacted and what the community concerns were at that time to give us something to compare to if you had those feasibility studies that you probably started back when that happened so that we can put it possibly together. Just a thought.

MS. WALLACE: Okay. Lou Turner and then David May. And please restate your name.

MR. TURNER: Hi. My name is Lou Turner. I'm with the Developing Communities Project. You have already heard from the president of our Red Line Oversight Committee.

I think a number of people here already know that the Developing Communities Project has been mobilizing the community and interest and opinions in the community around this project since 2003. And we put together a historic referendum in 2004 in which 39,000 voters in the 9th and the 34th Ward voted for this very project. And that's one of the things that the CTA has included as part of the reasons for their selection for the Locally Preferred Alternative.

I have a few things and I will submit it also in a written form, but in the instructions, particularly in the introduction to the folder that you have here, it says that -- the EIS scoping info says that the CTA and the FTA will be preparing the EIS. How will the FTA participate in the preparation of the EIS?

Secondly, what weight will public comment have in the decision-making process of the EIS and the preliminary engineering?

Thirdly, what governmental agencies will also participate? Because it says public comment and governmental agencies or agencies will participate in the scoping process. Will their comment and analysis be made public? If so, where? I assume the EPA and people like that. What weight will their input, that is, the governmental agencies, carry? And if there's a conflict between the input of the public agencies -- excuse me, the governmental agencies and the public comment, how will these conflicts be resolved?

You mentioned the proposal for topics of evaluation. One, it seems to me, especially for environmental impact that becomes important, is to identify brown fields along the route. I assume that there is some kind of map somewhere or there's some process at hand in terms of identifying -- 30 seconds -- identifying brown fields.

Secondly, if these brown fields are identified, I want to know what the process is for minority procurement opportunities for mitigating those brown fields.

And, lastly, what are the scoping -- what is the scoping analysis going to do in terms of

identifying transit-oriented development opportunities along the route?

MS. WALLACE: Thank you.

MR. TURNER: Thank you.

MS. WALLACE: David May and Harry Brooks.

MR. MAY: I'm David May. I'm here speaking as an individual. I think it's a very valuable project for underserved communities here on the south side, and I think these extension projects are great in terms of leveraging the existing facilities.

The cost estimates I have seen for the LPA seem very high compared to similar projects that have been built in other countries. CTA has a bad record in terms of managing large construction projects, and I recommend that you look at the Army Corps of Engineers' Early Contractor Involvement Process; P3 processes being used in Alberta and Ontario; FDoT's recent I-95 procurement; and how BART is doing the Oakland Airport Connector.

In looking at this extension, I thought the design criteria that should have been used would be to maximize the number of customers living within a half mile of a station. So you need more

stations and you need the routes running through residential neighborhoods; avoiding overlapping coverage with METRA; using existing rights-of-way; running on ground as much as possible; and serving Chicago State and Olive-Harvey.

I think a preferable way to design this thing which I think you should consider as one of your alternatives is a one-way loop, a 9 and a half mile long loop, one-way loop, instead of your 5 mile two-way design could give you seven stations, for example, at Ford and Rhodes, 103rd and Dauphin, 111th and Langley, 115th and State, 114th and Halsted, 107th and Racine, and I-57 and Halsted which would serve many more people within walking distance in your design.

It would give you 2 miles on ground in the Bishop Ford right-of-way. It would give you 2 miles on ground on the I-57 right-of-way; 1 mile on ground on the abandoned railroad right-of-way;

and 3 miles on ground in the excess railroad right-of-way, all which are great improvements compared to your mostly elevated, very expensive guideway design. Thank you.

MS. WALLACE: All right. Harry Brooks and

William James. Harry? William, you will be after.

MR. BROOKS: Good evening. One of the things that needs to be done immediately is something to relieve the bus turn-around at 95th and the Dan Ryan, because the number of buses that go in and out of there, they have outgrown that terminal.

When I was coming here this evening, I happened to get there in just one of those rare moments. I'm sure it was like a perfect storm. All the bus lines, CTA and PACE, plus a Greyhound all were in the station at the same time. And that was interesting to watch, but it caused quite a traffic jam.

So I would hope, of course, when this extension is put in that some of those lines that go up to 95th Street now would go to the new stations or that something be done somehow, even though it's kind of landlocked, to expand the terminal because you get all -- you get everybody in there at the same time and it just doesn't work.

The 111 bus that I took to get over here stops behind the Number 106 bus, for example. And the Chicago Police Department decided to park a paddy wagon next to where the Number 106 takes some

recovery time. So I wasn't late or anything, but we had to sit there until it was time for the 106 to leave, and there were a couple of other buses that were trying to get out.

Now that particular problem could be dealt with if CTA told the police that they would have to park large vehicles elsewhere. But something still needs to be done now and in the future for that 95th terminal because, as I said before, and I'm repeating, I know, if everybody is in there at the same time, it's not working. Fun to watch, but I'm sure it's not fun for the drivers.

MS. WALLACE: Okay. William James.

MR. JAMES: Okay. My name is William James. I've lived in Roseland all my life.

MS. WALLACE: Could you please speak into the microphone?

MR. JAMES: Yeah. I came here as a teenager. I'm very familiar with Roseland, all parts of it. I have lived all over the community.

I have also lived near train tracks. Where I'm at presently, I'm near that Union Pacific. My concern is noise, vibration, property damage. What happens is these trains roll past.

Right now, there's a group in our community trying to stop the whistle blowing of the train there. Okay. They're not very successful. They have been campaigning for years. It's not stopping. The train is still blowing the whistle. The noise goes on. I lived there 20 years. I'm now oblivious to it. Other people are not.

With a CTA train running down your mysteriously preferred location -- I don't know who prefers this -- I'm going to have constant noise. I'm telling you now, I don't want you. Go away. Go down Halsted.

I have another issue there. With these train tracks and these stations, I'm going to get dirt. I'm going to get crowds there that I don't want in my backyard. I live very close to 103rd. I don't want you in my backyard. I don't want you crawling through my yard going to the train station. It's an issue for me. Okay?

Another thing that disturbs me is that through these vibrations, they damage the foundations to your homes. Many people who live close to this train have cracked foundations. CTA is going to come, they're going to build their

little train, you're going to go ahead about your business, I'm going to be stuck with damage, more home damage. Okay? I don't want it. These are just issues that concern me.

You're only going to build on one side of the track. Many people are thinking that they're going to get money through eminent domain. You're going to come in and pay them and they're going to move off happy. But there's two sides of that track. When you build that train, elevate it, it's going to be running through some of your bedrooms. That train is up over your head. Only one side is going to get paid. The other people are going to get stuck. And I think we need to keep this in mind. This is not about money. This is about where we live and about our comfort. Thank you.

MS. WALLACE: Are there other folks who would like to comment this evening? Okay. We're going to be available until 8 o'clock to take comment if additional people come in or you decide you want to comment.

For those of you who don't, let me go over a couple of things. If you want to leave, you can leave. If you want to spend some more time at the board, you are welcome to do that.

So, again, tonight the verbal comments were reported by our court reporter. There's other ways that you can submit your comments. So you can write comments and place it in the box over here. You're welcome also to mail your comments to the contact and contact information listed here. You can e-mail or you can fax your comments.

We also encourage you to keep updated on what's going on with the project, and a couple ways to do that, one is to regularly go to the Web site that you see here on the screen or you can join the e-mail mailing list by writing to Darud.

So thank you so much for your input this evening. We appreciate it. And, again, we'll be available for comment until 8.

(Whereupon, there were no further speakers.)

(Public Hearing adjourned at 8 o'clock p.m.)

STATE OF ILLINOIS)

CHICAGO TRANSIT AUTHORITY
PUBLIC HEARING
"RED LINE EXTENSION
CONNECTING 95TH STREET STATION TO 130TH STREET"
September 24, 2009

STENOGRAPHIC REPORT OF PROCEEDINGS

had in the above-entitled matter held at the Woodson Regional Chicago Public Library, 9525 South Halsted Street, Chicago, Illinois, commencing at 6:48 o'clock p.m.

PRESENTERS:
MR. DARUD AKBAR, Government & Community Relations Officer, Chicago Transit Authority
MR. JEFFREY BUSBY, General Manager, Strategic Planning, Chicago Transit Authority
MS. SARAH LAYTON WALLACE, Moderator

Reported by: Anna M. Morales, CSR, RMR
License No.: 084-002854

(Whereupon, the following proceedings commenced at 6:48 o'clock p.m.)

MR. AKBAR: Good evening, everyone. My name is Darud Akbar. I'm with the Government & Community Relations Department at the Chicago Transit Authority. I want to welcome and thank everyone for coming to the Red Line -- this is actually our second public scoping meeting. So I want to thank you for coming out this evening.

I'm going to turn things over to Sarah. Sarah is going to talk to us about tonight's agenda, and then we're going to go into a brief presentation and come back to Sarah to explain what our rules and regulations are for this evening. So thank you once again.

MS. WALLACE: Great. Good evening. Before we get started, I want to check, is there anybody in need of Spanish translation? Okay. So we have that service if anyone is in need of that.

As you see from our agenda this evening, we've just completed the open house portion of the meeting. In just a moment, I'm going to turn it over to Jeff Busby, and Jeff is going to give a

brief presentation on the project, and then we're going to go into the formal public comment period of the meeting. And right before we do that, I will walk through some guidelines. We are going to be limiting comments to three minutes. So be thinking about that now as you are composing your thoughts, those of you that are speakers. I will go over some other things to get us on track. After the public comment period, then we'll go over some next steps and adjourn the meeting.

And I do want to note that if we conclude before 8 o'clock, you will be, you know, free to leave if you want at that time, but we are going to stay here and available for anyone who arrives and still wants to comment. So we'll remain here until 8 o'clock for sure.

So with that, Jeff will provide a presentation.

MR. BUSBY: Hi. Thanks for coming out again. I'm Jeff Busby. I work in the Planning Department at CTA.

I wanted to give you a background on where we are on the Red Line Extension. Really, the idea for bringing the Red Line further south has been

around for a very long time. In the 1960s, when they were building the freeways, they left space for a Red Line Extension; and, recently -- and this is not a new problem -- but recently the CTA has started a study called an Alternatives Analysis, and that study is intended to look at a whole range of transit options to try to improve some of the transportation problems south of 95th Street.

Many of you are aware, if you take CTA, that the 95th Street station is very crowded. There's lots of buses going there and there's lots of delays associated with getting there. So people have very long trips sometimes to get to the existing station.

So what we could accomplish with an extension of the Red Line is shorter and faster trips for people to get to CTA services as well as solving some of those congestion problems at the 95th Street station.

As I mentioned, we started this study in 2006. We looked at a whole range of options and identified a couple of options which we're going to talk about tonight which we're advancing into this next step. Part of the Alternatives Analysis

included public involvement. So we've been to Woodson Regional a couple times and actually had a series of other meetings -- three rounds of meetings with six total meetings prior to this leading up to tonight's recommendation.

The local -- I'm sorry. The Alternatives Analysis ended in August when the Chicago Transit Board adopted what's called a Locally Preferred Alternative. It's the one option that, resulting from the study, looks to be best at solving the problems we've identified, and that is an extension of the Red Line, following or running next to the Union Pacific Railroad at about 400 west. I will show you a map in a moment.

So tonight's meeting starts the

Environmental Impact Statement which very much relies on the previous work we completed in the Alternatives Analysis.

So what's an Environmental Impact Statement? The CTA is hoping to use -- to ask for federal money to pay for a portion of the extension; and any time you use federal money for a large project, you have to comply with the National Environmental Policy Act. And the National

Environmental Policy Act, or NEPA, requires that the CTA in a public setting identify and evaluate the potential impacts of both building an extension and operating an extension for the Red Line.

And the idea here is to help us make decisions about the environmental impacts and where -- and they're both positive and negative environmental impacts -- but where we identify negative environmental impacts, come up with potential ways to mitigate those, make them less adverse.

This is a schedule which gives you an idea of where we're headed. As I mentioned, we're starting the environmental process tonight with these scoping meetings. We had a meeting, very same presentation, a couple of days ago on the same subject. We're receiving input on what we should study in this environmental process.

We'll come back to you next year with the results of the environmental process in what's called a draft EIS, a draft Environmental Impact Study, and that's your opportunity to review both the impacts we've identified and what we proposed to mitigate them.

At the same time, we're going to be asking the federal government for additional funds and permission to start more detailed engineering. That's called preliminary engineering on this map. We think that process would take about two years. And so by 2013, we would need to have identified all of the money, both the federal and the nonfederal share, to fund the extension, and we would need federal permission to begin the final design.

2013 would be the year in which we would start construction. We show a three-year construction period; and the Red Line Extension opening for operation in 2016.

It's important to point out that this is our targeted schedule. It's not something we can guarantee. There's a couple of reasons for that. As I mentioned, we rely on additional funding from Washington, D.C., to continue these studies, and we also rely on permission from the Federal Transit Administration. But we think this is an achievable target and we're going to pursue it.

We're going to study alternatives, project alternatives in the Environmental Impact Study.

This is a list of them. The first alternative is a No-Build Alternative. It's really important as a point of comparison. What this alternative is is what would be the impact to the environment of not doing anything?

We're also going to study what's called a Transportation System Management Alternative. That's a very long name, but what it means is a lower cost alternative to building a rail extension. In this case, it would be an express bus service with limited stops; some technology to help speed the buses down the road through giving them priority to traffic signals; and a pretty significant expansion of the station at 95th Street to make the buses in that corridor work better as well as accommodate new buses in this alternative.

We also will be studying what's called the Locally Preferred Alternative, an extension of the Red Line following the Union Pacific rail right-of-way, an elevated extension, I should point out.

And we have identified a fourth alternative which is also an extension of the Red Line but follows Halsted Street.

Let me show you a map of the Locally Preferred Alternative. So starting with the map on the left, the Red Line would run south from 95th Street in the middle of the I-57 highway, and then it would climb up out of the highway and run elevated at about 400 West Eggelston Avenue and would travel next to the Union Pacific rail right-of-way all the way south to 130th. It would make four stops. The stops are at 103rd, 111th, 115th and Michigan, and 130th and the Bishop Ford Expressway close to Altgeld Gardens.

We're also showing two options here, the reason there's two dotted lines. We have a choice of being on the east or the west side of the freight rail tracks.

The Halsted alternative is a similar link. It runs about a half mile to the west. So, again, the train would use the median of the expressway, I-57, traveling south. When it gets to Halsted Street, it would go into the air and run down the middle of Halsted Street, above the street. It would make four stops again at 103rd, 111th, and 119th, and at Vermont which is about 127th.

This is an elevated structure. The

columns to support the elevated structure would be made of concrete most likely and be placed in the median of Halsted Street.

So those are our four alternatives. We are interested in your comments tonight. I'm going to turn things over to Sarah to give you some instructions on how we're going to receive those.

MS. WALLACE: Okay. It's time for the comment portion of our meeting; and, as promised, I want to go over a few things with you.

Because we're working on this environmental study, there are sections that we need to write and we need your input in order to do that. So we would ask you to focus your comments tonight on these areas: The purpose and need for the project; the proposed alternatives; the proposed environmental issues to be examined; and the potential environmental effects and the mitigation measures to be considered. So those are the areas we specifically need your input.

Some guidelines. If you haven't done so already, please submit a speaker card, and we can collect those and they will be brought up front. I'm going to call speakers by name. I will

probably call several at a time so that you can get lined up and prepared to speak. Here's the mic you will use, the standing mic on that side.

The first thing you will want to do is restate your name. I may not get the pronunciation right, and we want to make sure that we have that right for the record. We've got a court reporter here that is going to be documenting your comments.

You'll have three minutes to comment. The good news is you're not going to have to try to keep track of where you are in that three minutes. We have this stoplight here that is going to assist you in that process. So once you start, we'll turn that on and the green light will turn on, and that lets you know that your three minutes are starting. Once you have 30 seconds left, the light will go yellow. And once you have 15 seconds left, the light will be flashing yellow. So that kind of helps you gauge wrapping up your comment. And once it turns red, that means your comment period is up.

So we would like everyone to keep to the three minutes so that we can keep things moving and we're hearing from everyone who wants to speak tonight.

Because we're here tonight to hear from you -- that's the whole purpose of the meeting is to hear your comments -- CTA is not going to be responding to your comments tonight. We're going to be listening. We're going to be documenting and all your comments will be documented in the report.

So we would ask you to -- there are two folks from the CTA here. We would ask you to direct your comments to them, but do, again, keep an eye on the light.

So our first speakers up: Thomas Brown,

Senior, followed by Rob Kelsey, and I believe this is McClellan. So are those folks here?

Yes. And I do want to remind everybody, if you haven't done so already, turn off cell phones or pagers or at least change the setting to vibrate so that we don't cut into people's time that are speaking.

Could Thomas Brown, Senior, please approach the microphone? Go ahead.

MR. BROWN: Again, my name is Thomas Brown, Senior. I live directly in the area where the proposed train will be built and constructed. My comments center around myself as well as my

neighbors. I'm right on 325 West 99th Place, directly in front of Wendell Smith Park, and most of my neighbors are senior citizens.

So in the environmental study, I would like for you all to take into consideration the fact that a lot of the homeowners are senior citizens and the fact that we would want -- we don't want to be -- they don't want to be disrupted unduly, and just to take those factors into consideration in the environmental study, as well as Wendell Smith Park is a park that is utilized, and also to look at, in addition to what you're already studying, the noise impact and the safety impact of that park.

Another comment I would like to make is

the fact that the proposed plan going down Eggelston Avenue, it's very residential, and there's definitely some concern about having a commuter line directly through the residential corridor that's there. Those are my comments. Thank you.

MS. WALLACE: Thank you. Rob Kelsey, and then McClellan, and then Dorothy Boyd.

MR. KELSEY: Good evening, everyone. My name

is Robert Kelsey. I'm a Chicago Public School counselor. I work in the West Pullman area, Gompers Fine Arts Option School.

As a counselor, I fill out numerous applications, help students fill out applications for high school. And being an educator, I also recognize that a number of students don't get downtown unless it's a field trip a lot of times. So this new Red Line or -- I'm not sure exactly what this -- Red Line Extension will be helpful in a lot of aspects.

I heard the speaker before me. He had a lot of excellent concerns there, but I think there's also some advantages for some of our younger people. So that's my comment. Thank you.

MS. WALLACE: Okay. McClellan? Could you state your name and speak directly into the mic?

MS. McCLELLAN: Gina McClellan. I have three concerns. The lighting around the tracks that are going to be made, and I was hoping that we could be able to see some kind of visual, what this was going to look like, but for security reasons, will it become dark like the El stations down by Lake Street? That was a question.

The construction time, how long is this going to take, 2016? And then once you start, what does it do to me? Is it going to be three, four years where I'm going to be inconvenienced where I can't even get into my home since I'm right off of Halsted Street.

I'm concerned about the noise level that I will have to live with the trains going constantly. I'm concerned that the parking lot that you're going to put there, when it's filled, that I can't park on my block because I'm one block off of Halsted. So are those things being taken into consideration, too?

MS. WALLACE: Okay. Dorothy Boyd, Lou Turner, and Ben Christy.

MS. BOYD: My name is Dorothy Boyd. My concern is the families on Eggelston Street; I need to know if they're going to be relocated. We don't want to be relocated.

I want to know how the property value, how will that affect us? And I want to know about the incoming traffic that this is going to cause.

There are a lot of seniors in our area,

and we do not want to move. We already have that

train that goes down Eggelston. It keeps up a lot of noise. We need another batch of noise like we need two heads. I'm not seeing this.

MS. WALLACE: Lou Turner, Ben Christy, and John Paul Jones.

MR. TURNER: Hello. My name is Lou Turner. I'm the Public Policy Director for Developing Communities Project which is a project for the last six years.

My concern is really just singular tonight -- I spoke on Tuesday -- and that's the impact, the positive impact, the collateral benefits that this project could have for the residents in Altgeld Gardens, 130th Street, which is where the Red Line Extension would end.

Back in 2005, we did a study which showed that of all the households in this area, one out of four of these households don't have or don't own an automobile. That's the same as the 9th Ward in New Orleans; and were the same kind of catastrophe to hit, we would have the same kind of crisis of this community that we saw in New Orleans at the time of Katrina.

I think that given the history of

transportation planning, in big cities like Chicago, where very often minority communities have been more the victim than the beneficiary of transportation planning, this is an opportunity and, particularly out of Altgeld Gardens, to really provide access to one of the most isolated communities in the city. This is an opportunity to use transportation planning to provide benefit rather than victimization of a minority community.

So I would ask that the Environmental Impact Statement look at the environmental impacts that would be for the residents at Altgeld Gardens; and the fact that Altgeld Gardens is an area that has high toxicity; a lot of waste sites surround the area. It is one of the highest levels of cancers in the city amongst any group of people.

And so with the construction of this Red Line Extension, it seems to me that one of the key environmental impact factors or areas of analysis should be the impact that the construction of the Red Line Extension would have on mitigating the toxic degradation out at Altgeld Gardens and the opportunities that would provide for a very isolated community.

So, again, I urge that CTA really focus singularly on Altgeld Gardens and really push the LPA, the Locally Preferred Alternative, which is the one that would go to 130th Street. None of the impacts that are mentioned here, a number that others can think of were mentioned, would really be mitigated by the other alternatives. Only the alternatives, the LPA going down to 130th Street near Altgeld Gardens would really impact favorably these communities in these areas. Thank you.

MS. WALLACE: Ben Christy, then John Paul Jones, then Donald Miller.

MR. CHRISTY: Yes. I'm Ben Christy. I don't live in the area. Instead, I use the Red Line to get to the area. In fact, I didn't go to the other impact study because I couldn't -- you know, I'm sure there's a bus that gets by there; but 95th, 95th station, what bus to use and everything, I just didn't do it. So that's why I'm here today instead of Tuesday.

I actually do live right next to the Red Line by Berwyn. Come on by and say hi. The noise of the train, hey, it's a train. When I grew up, I lived a block away from the train. Now I

live just across the alley from a train. Yes, it's a noise. You get used to it. So don't worry too much about that.

The thing I'm worried about is the TV reception every time a train goes by. With this new better TV? No way. Anyway, that has no effect with this group.

What I see on the alternatives here is

that there are people in the Halsted area that don't want their train down Halsted; but, if I wanted to get to Halsted there, I would use the train to get to your businesses.

The plan -- the LPA, which is not the Halsted, does have the positive that it could help bring people in from out of state if we have enough parking, park-and-ride spaces. So I would expect you to decide how many park-and-rides you want and then triple it.

Other than that, we need more trains. For years, we've needed more trains. Some people will be discomforted by the building of them, but don't let that keep us from plowing ahead. They have said for years that they expected to extend this, but they haven't.

MS. WALLACE: 30 seconds.

MR. CHRISTY: So please give us -- give us our ride, extend it as much as possible. Thank you.

MS. WALLACE: John Paul Jones, and Donald Miller, and Thomas Jundanian.

MR. JONES: I'm John Paul Jones. I'm an organizer for the far south region, also a resident in the Englewood District. For 50 years, I've been involved in organizing and urban planning, and I have seen a significant value in the Union Pacific Railroad corridor. And if you look at the far south region, they have always had a challenge of public and private -- the investment. That Union Pacific corridor provides a venue where you can begin to introduce to the community, a very urban community, a whole new set of ideas and investment around transit and developing that and turn that corridor, provide venues so that the end of the station can add value to the property, at the same time, give greater access to the greater part of Chicago.

Also, from Englewood, we've always had challenges with getting transportation to jobs; and with the Union Pacific Railroad corridor, again,

you can begin to hire a lot more people, connect with the south suburban communities that are going to have job growth, much more than you get in Chicago during the economic downturn.

But, also, the environmental impact piece that we're concerned about and want to speak to tonight, that corridor, much like rail corridors throughout my community of Englewood, areas where there's always a decline of public investment and through the years you had accumulation of blight, if you look at that corridor, you look at a corridor that is over ran with many forestries now. There's open space that's been denied any real attention for many, many decades.

So it's an opportunity for you, the city and the community, to kind of think through how do we use these corridors more wisely and strategically to improve our community, encourage reinvestment, and increase the travel time for us to get to work or recreation and other venues.

So it's a real plus for the region more than a negative. I would want to encourage that more -- supporting what the person said from 95th Street corridor. Certainly, we want to be

careful and considerate of the residential impacts. We want to be very careful of the impact to the brown field districts, but also opportune as possible relative to the eroding issues. We certainly want to be helping the community anticipate and remediate any particular eroding problems that may occur in some of these wooded areas that have been neglected for 30 or 40 years.

So we want to use that opportunity to work more closely with any governmental plan to figure out ways to impact the environmental impact on the roads maybe through this reconstruction strategy. Thank you.

MS. WALLACE: Donald Miller, Thomas Jundanian, and Lori Baldwin.

MR. MILLER: Thank you. My name is Donald Miller. I heard a lot of complaints -- concerns, rather, about the environment and the noise and how the train would sound coming through the communities. But this is dealing with rail. I think we should take a model from some of the rails that run on the north side. You know, you are going to have these type of problems.

What we are trying to do is get a system

that would fit our community, that would be accessible for us to get in and out of our community efficiently and safely. And I would think the transit people should look at the highest concentration of the population, where could -- the highest volume of population and let the train be used in that corridor, in that area where the population would be affected the most.

And I think it's an excellent idea because the south side of Chicago needs a little bit more of a public system in our community, and I'm for it, and I hope that it happens very soon. Thank you.

MS. WALLACE: Thomas Jundanian, Lori Baldwin, and then Bradena Thomas.

MR. JUNDANIAN: Good evening. My name is Thomas Keith Jundanian. I'm the third generation owner/operator of an 85-year-old Roseland-based business. I'm a Roseland boy, born and raised.

I have a different perspective on this than maybe some, having grown up in this community and having our family business based here all the time, all those years. I'm not 85, but -- don't rush me.

On the heels of Donald's comments, I too kind of feel like the south side of the city has been a very neglected location in our beautiful metropolis, and it would be -- I think either one of these plans are going to be a positive thing for us. I'm not qualified to say which one is going to be better than the other.

Initially, I was surprised to find out that the LPA was the preferred alternative with more public support because it seems that it's going to disrupt some lives, some memories, some households if it occurs on the east side of the tracks. If it's on the west side of the tracks, I know from my own childhood and playing in some of those empty lots, there's more industry over there.

My business is located on Halsted Street at 116th Street. It's the K. A. Pridjian rug store, that big old rug store there on Halsted Street. So one of the concerns that I would have as a business owner having seen long construction projects mean the demise of some businesses that have been interrupted with their traffic flow.

What have previous construction projects like this and studies that have gone on indicated with those businesses? How are they impacted? I have got nothing to base this on. When this trestle goes up on Halsted Street, what is it going to look like? It's probably going to be concrete. Jack and I were talking outside. Would it be something that's attractive? Will the elevated tracks all the way down Halsted Street create a lot of dark shadows, a lot of shadowing areas where people can congregate and do things that are not in the best interest of the community? Will the trestle be placed where garbage and other debris and litter accumulate? Will it be a blight to Halsted Street?

As far as bringing people down Halsted Street, yeah, it will. The stations are going to be -- you know, 111th and 119th are a mile apart. So that's still quite a ways to try to get to one of the businesses. I was chatting with a lady who also has a building at 108th and Halsted. That kind of encapsulates some of my concerns. I think either one of these things are a positive thing for the south side, whichever is best for our city and our community. Thank you.

MS. WALLACE: Lori Baldwin, and then

Bradena Thomas, and JoAnne Guillemette.

MS. BALDWIN: I am Lori Baldwin, and I'm representing the West Chatham community and the Park Advisory Council of that area, but I'm also part of the Red Line Oversight Committee.

I would just like to interject that I'm thanking the FTA for requiring this public hearing as well as CTA for selecting the Union Pacific Railroad as the locally preferred route, particularly, because this route will give the greatest need and take care of a lot of the needs of disparity that we have had in that community for a very, very long time on the south side of Chicago, to give us more transportation options; as well as we have had the opportunity on September 18th, some of the members of DCP Red Line Oversight Committee toured the entire Union Pacific Railroad, and we examined the physical and environmental conditions and the impact along the corridor, and we found that there are documented parkways, homes, small businesses, and tracks of forestry along that route.

However, most of that route, as has been stated before, is open space, and so this would be

a great asset to the community. Also, because of the need for us to have transportation in this area, and it's been such a long, long time, this is the area that I think the city should be focusing on much more than some of the other options.

We also looked at the environmental impact, and this provided greater access to a number of residents. And also this route had less environmental impacts in terms of conditions and areas and the taking of homes.

So I, again, just want to encourage you and let you know that the community will benefit from this new development. Thank you.

MS. WALLACE: Bradena Thomas and then JoAnne Guillemette.

MS. THOMAS: My name is Bradena Thomas. I am concerned as a senior living in the area. In fact, I'm right at 97th and LaSalle which is where 94 and 57 split.

My concern is whether or not there would be an elevated track right behind me or whether it's going to be recessed?

Also I have a business, a building on Halsted at 108th. Now is this going to be an

elevated structure which would darken, you know, the area? So that is my concern for both. But I definitely wouldn't want an elevated area looking out of my backyard. That's my concern.

They do need transportation to the south because 95th is extremely congested, and I realize that; but, hopefully, I wouldn't want to have to move. Thank you.

MS. WALLACE: JoAnne Guillemette.

MS. GUILLEMETTE: Good evening. My concerns have been previously stated by several others, but to say it as succinctly as possible, my concern would be for the increased foot and vehicle traffic; the increased debris; as well as the increased crimes that would follow a structure like this.

I have lived near the Red Line and I know that it also -- because of the activity and vibration of the ground, it increases the presence of termites and other rodents. And when you're dealing with termites, you're talking about the destruction of homes; and, to prevent it, homeowners would incur tremendous expense on a yearly basis to ward off the termites. So that's

an extreme concern for me. And I would hold that for other homeowners as well.

Further, who would bear the maintenance expense of this extension? Because the homeowners nearest the tracks, are their property taxes going to increase? Is their property value going to go down? And what mechanisms are being put in place to address these issues? Because it's my feeling that you're going to go ahead with this in spite of what we say. And especially if we should be successful with our bid for the Olympics, this is going to be a major development. It's going to be pressed forward, and the residents need to know the true impact on them in terms of dollars and cents. Thank you.

MS. WALLACE: Could you please restate your name for the record?

MS. GUILLEMETTE: JoAnne Guillemette.

MS. WALLACE: Thank you. Are there any other speaker cards? Gwendolyn Rice and then Barry Finkel.

MS. RICE: My name is Gwendolyn Rice, and I work for Developing Communities Project which has been working with this issue for six years.

MS. WALLACE: Could you get little closer to the mic, please? Thank you.

MS. RICE: But I think I'm coming from a more personal point of view, because all the other issues have been talked about.

For the last I won't say how many years of my working life, I have worked in one way or another with residents of Altgeld Gardens as a counselor or as a recreation worker or just simply knowing children who live there or adults who live there. And I remember and I just -- my mind was refreshed on the way in when one of the workers outside mentioned that she had lived in Altgeld Gardens and she remembered having to take the PACE bus into Chicago and then taking a CTA bus and then finally getting to the Red Line.

But I remember also having to take kids home at night because the transportation was not available for the kids to take advantage of the amenities in Chicago. I remember many times having to do that, even in the afternoon having to do that, which I didn't mind doing because I could do it. But their parents may not have always been able to do that, provide the access.

This project is going to provide access to what is a transit disadvantaged community. We are kind of in competition with other lines throughout Chicago that are going beyond the city limits. On the south side, there's nothing that goes to the city limits. And I really say that we must take that Locally Preferred Alternative through to 130th Street. I don't think there's an alternative. That's the only option.

I don't know what else to say, but I just am passionate about the fact that you're going to Altgeld Gardens, an isolated community that is not outside of Chicago. It is in the Riverdale community area of Chicago -- not in Riverdale, Illinois -- and it's important that the CTA go at least to the city limits to serve its constituents. It will also serve people who live in the suburbs who commute to Chicago who will have a chance to park and ride and ride downtown and eliminate a lot of pollution.

Again, I just want to speak on behalf of the residents of Altgeld. I don't live there, but I have been there many times. I have worked there, and it can make a big difference in providing an opportunity for people to have access, to be able to be exposed to the larger community. As the teacher said earlier, people generally who live in transit deserts do not get out and understand what's going, and it would cut down on violence and cut down on a lot of other factors. Thank you.

MS. WALLACE: Thank you. Barry Finkel. If there is anybody else who wishes to speak, send your speaker card in.

MR. FINKEL: My name is Barry Finkel. I have been a resident of the Beverly area, 103rd and Western, since 1951, and I take the Red Line downtown at least once a week. I see at 95th Street station lots of PACE buses coming in from the south suburbs, and I think an extension of the Red Line would help in getting those buses -- to get the train and not have to come all the way to 95th Street to service those people.

We're talking here about public transportation, and I see in all the alternatives, there's talk of park-and-ride. It seems to me, and I have sort of a disagreement with some of the speakers, but it seems to me that if we have good feeder bus lines into the stations, there's no need

to have a large park-and-ride facility at each station. Maybe at the farthest station. But I don't see really a need, for example, a big park-and-ride station at 103rd and Halsted. There's no room there for a park-and-ride, and I don't see any need for it. Thank you.

MS. WALLACE: Alice Harper-Jones.

REV. HARPER-JONES: Good afternoon. I am Reverend Alice Harper Jones. I'm the Dean of Cluster 6 of Chicago Metropolitan Association of the United Church of Christ and represent about 13 churches on the south side. And I'm also a member of the Chicago State University Alumni Board, and so I'm speaking, commenting on two things.

The first one is our churches. There are people who live on the far south side who will have better access to the church, being able to get there and to get back home again, especially those who do not have cars or sometimes you wake up and the car is not working. So I think that would be positive for those people.

Also, from Chicago State University. I'm thinking in terms of our academic program that we

have there, it would be better accessible to many, many people; and those young people that we're trying to attract to the university would certainly be able to have access to and from the university. Especially if a person is working, they can come in the evening to attend the university and be able to go back home again without having to, you know, wait for buses and everything on 95th Street because Chicago State is very accessible to 95th Street right there.

My concern is that -- one of the proposals I looked at, the Halsted Street would still -- there's still a gap it seems like from Halsted Street all the way to the Altgeld Garden projects there. So in constructing, you know, that Halsted Street project -- and I'm kind of leaning toward Halsted because you're not destroying homes. But if you can, you know, think in terms of your construction of getting that closer to the people in the project, then they don't have to take a bus from Halsted to where their home is so that they would be able to have access to the university and to the churches.

Again, as I say, I prefer the Halsted one

because then we're not destroying homes. People have lived in this community -- I live in the community. I know the value of my home, and I don't believe that if you give me fair value that it will be -- you know, it would really come to where I think that my home should be priced at because of the improvements I have made.

So that should be a consideration especially when we think about seniors who have been there for years and who take pride in their home and their neighborhoods and their friends around there, that to destroy that community, you know, with the train is not a preferred option. Thank you.

MS. WALLACE: William Warren. Please restate your name.

MR. WARREN: Good evening. It's William Warren, W-a-r-r-e-n. I'm here representing the Vernon Park Community Council. I'm president of the Vernon Park Community Council. We live in the area as well. I'm also a member of the Oversight Committee who had the opportunity to do a tour of the actual site last week -- actually, this week.

And, you know, we feel that by all means that the Red Line should be extended to the south side. We're in support of it. We think it would be a positive move in every respect. A lot of comments that were made earlier in reference to the rodent issues, the way the tracks are going to look, the lighting issues, the garbage and that sort of thing, of course, we're very concerned about those issues, but we feel very in support of bringing this extension to the south side. Thank you very much.

MS. WALLACE: Are there other speakers? Okay.

Again, we're going to be here until

8 o'clock if others arrive and still want to speak. I did want to mention that scoping comments are due by October 27th. So in addition to speaking tonight, you have an opportunity to write comments and place it in the box outside. You have an opportunity to mail in comments, fax or e-mail your comments. And we'll make sure this is back up for your reference.

We also encourage you to stay involved. You can visit this Web site. You can also get on an e-mail list so that you can receive updates

through e-mail and through Darud, if you'll e-mail him.

Any other comments at this time? Have you filled out a card, sir? Right now, we're taking public comment. If you want to fill out a speaker card and come to the mic --

MR. TURNER: I did.

MS. WALLACE: Well, three minutes is the rule. Are there others that want to speak?

We'll stick around. You are welcome to spend some more time out at the boards if you like or you are welcome to head on out, but we'll be here until 8 o'clock.

(Off the record at 7:34 p.m.)

(On the record at 7:46 p.m.)

MS. WALLACE: Johnnie Burke. Please restate your name and speak directly into the mic.

MS. BURKE: Johnnie Burke, and I'm a member of the 96th and Prairie Block Club. I had two questions. One, how many residences would be disturbed with the park-and-ride construction? And also, in the entire project, how many residences would be destroyed? How many people would be removed from the community? Thank you.

(Whereupon, there were no
further speakers.)

Mr. Jeffrey Busby
General Manager, Strategic Planning
Chicago Transit Authority
RedExtension@transitchicago.com
OrangeExtension@transitchicago.com

Dear Mr. Busby:

I am writing in response to your request for comments regarding the environmental reviews that will take place pertinent to the potential expansions of the Red and Orange Lines of the Chicago Transit Authority.

For both projects, the City of Chicago's Department of Streets and Sanitation (DSS) would like the review committee to consider the following comments and concerns regarding the expansions during the environmental review process:

1. The location of any street lights that will need to be removed or relocated as a result of the new lines;
2. An analysis of the affect these elevated concrete supports will have on street level lighting and any steps that will be taken to supplement street lighting in these areas, i.e. CTA-provided lighting on the underside of the elevated line;
3. The location of any public way trees that will need to be removed as a result of the new lines or the construction activity and a replacement strategy for those lost trees;
4. The level of assistance the CTA expects to request from DSS for services such as street "No Parking" postings and the towing of illegally parked vehicles during the construction phase of these projects;
5. The creation of a rodent abatement plan for the affected land which includes required sign-offs by the DSS's Bureau of Rodent Control prior to construction;
6. A plan for the proper storage, removal and recycling of all construction and demolition debris in accordance with all City of Chicago ordinances; and
7. A commitment to having platform level recycling containers and space at street level for the storage of recyclables prior to being separately collected from the garbage.

Thank you for your consideration of these issues

Sincerely,
(SIGNED)

Mr. Richard L. Rodriguez, President
Mr. Jeffrey Busby, General Manager, Strategic Planning
Chicago Transit Authority
P.O. Box 7602
Chicago, IL 60680-7602

Dear Messrs. Rodriguez and Busby:

The Department of Environment (DOE) appreciates the opportunity to comment on the proposed extension of the Chicago Transit Authority (CTA) Red and Orange Lines. We are supportive of both projects and the increased service to currently under-supported communities.

Three sections follow; the first is a list that applies to both projects, the second focuses on the Red Line, and the third on the Orange Line.

BOTH PROJECTS
Please evaluate:

- Recycling opportunities at stations and parking areas
- Alternative energy options including solar, solar thermal, wind and more to provide electricity and heating / cooling where needed
- Opportunities to install solar arrays (on rooftops, large expanses, etc.) to return energy to the grid
- Reduction of light pollution through the use of downward-facing lighting
- Compliance with the city's stormwater ordinance, including using bioswales, rain barrels and other methods to reduce the first flush of water into the sewer system
- Native landscapes requiring little to no irrigation
- Green roofs on any facilities
- Bicycle access and parking
- Permeable paving for the Park-N-Ride areas
- Preferred parking for fuel-efficient vehicles
- Charging stations for electric vehicles
- The City's new Soil and Rubble Reuse Intergovernmental Agreement applicability – extensive reuse of materials during demolition and construction could be possible
- Impacts to wildlife or other important natural resources

RED LINE

DOE will be constructing the Ford Calumet Environmental Center, a 38,000 square foot environmental education facility near 130th and Torrence in Chicago. We are supportive of a joint Metra / CTA station at 115th Street and are very interested in the possibility of an intermodal connection between NicTD/South Shore Line and CTA at 130th Street. These joint stations would allow residents from Indiana and the suburbs to easily gain access to our Center. We would also invite discussion around a bus turnaround at the Center for the 130th and Torrence buses or other buses with similar routes.

ORANGE LINE

Of particular concern to DOE are issues relating to neighborhood compatibility and environmental justice, primarily in relation to historical and/or privately owned parcels that may need to be acquired for the project. DOE would also be interested in a detailed evaluation of noise and vibration, including additive effects associated with Midway airport operations, to determine how such issues will affect neighboring properties.

We offer our support and assistance with any of our comments as appropriate. Thank you for the opportunity to comment on these important projects.

Sincerely,

Suzanne Malec-McKenna
Commissioner

Please comment on the proposed alternatives, the purpose and need for the project, the proposed topics of evaluation and the potential impacts and mitigation measures to be considered. Comments must be submitted by the close of business on October 27, 2009.

Even though there was one other option presented at the Sept. 22nd, Scoping Mee
- cant see the purpose being fulfilled using it or the HRT Alternative route. Your goals as
stated on page 11 appears to be more efficiently implimented by the Locally Preferred Alt
West and South side of the exsisting track. That being said, What is the distance fro
the track of property in need of occupancy removal? Where on the time-line would
those individuals be contacted? How would these persons be contacted? Who (what
division of Management) will be responsible for those notifications? Will the Engineers
be aware + take under consideration the ability or inability of homes that structually could
not withstand Ⓐ the building/Construction affects (the shifting of landscape (Consequently home structures
Ⓑ upon opening the rail-traffic.
I think the age of the structures must be taken into consideration not only
distance.
I commend you on your objectives - knowing how very much this new system
is needed and I hope an open and fair Communication Line will Continue throughout the Project at

RE: CTA Alternatives Analysis Projects: Red Line Extension, Orange Line Extension, Yellow Line Extension.

Dear Mr. Busby:

This letter is regarding CTA's Alternatives Analysis Projects: Red Line Extension, Orange Line Extension, and Yellow Line Extension.

Red Line Extension
The Little Village Environmental Justice Organization (LVEJO) supports the CTA's Red Line Extension to 130th Street along the UPRR route. We support the efforts of the Developing Communities Project (DCP) to extend rapid transit to underserved areas in the African-American communities of the South Side. Once the CTA demonstrates sufficient progress toward bringing the existing rail and bus system into a State of Good Repair (SGR) and sufficient progress on maintaining, enhancing, and expanding the bus system, this project needs to moved forward with the utmost urgency. Originally proposed for completion in 1970, we believe that the Red Line Extension to 130th Street should be CTA's first capital expansion priority for the El. It must take priority over the CTA Circle Line and the Metra Star Line in order to remedy the systemic and institutional racial discrimination created by unequal access to rapid transit on Chicago's South Side and South Suburbs. This project would greatly reduce the travel times of transit riders traveling between Chicago's far South Side and Downtown Chicago, providing significant economic benefits to riders and the regional economy.

Orange Line Extension
LVEJO supports the CTA's Orange Line Extension Project. CTA should build the Orange Line Extension as part of the Mid-City Transitway (Cicero Beltway Railroad). Additionally, CTA should evaluate a potential station at 72nd and Cicero to provide access to Walmart and other work/shopping destinations.

Yellow Line Extension
LVEJO believes that the Yellow Line Extension should be given lower priority, under the Red and Orange Line Extension. CTA should study how this project could be integrated into the Mid-City Transitway as per previous studies commissioned by the Chicago Department of Transportation (CDOT). Given the large number of complaints from local residents, CTA needs

to modify the Locally Preferred Alternative (LPA) to accommodate the needs of those raising objections to the project. If the LPA cannot be modified to satisfy these objections, then the project should be cancelled.

Additionally, all new CTA capital construction projects should meet or exceed federal Title VI Disadvantaged Business Enterprise (DBE) requirements. They should also work to provide jobs to low income community members from the surrounding area.

Sincerely,

Michael Pitula
Community Organizer – Public Transit

Subject: Red line EIS scoping comments

Pace scoping comments regarding CTA Red Line Extension Environmental Impact Statement

Thank you for the opportunity to review and comment on the scoping of the Environmental Impact Statement for the Red Line extension. Below are comments regarding the proposed project alternatives and potential environmental impacts relating to the proposed extension between 95th Street Station and 130th Street.

- Pace supports the rail extension of the Red Line from the current terminus at 95th Street Station to 130th Street
- In compliance with the Illinois Auditor General's recommendation to reduce CTA & Pace overlapping service and provide greater suburban market coverage area, Pace intends to restructure various south suburban routes operating on Halsted and King Drive which now serve the Red Line 95th Street Station. Additional planning development and review would be required to determine the most optimal station(s) to serve on either alignment.
- Arterial roadway access to/from the proposed station(s) served by connecting bus services will require further review including issues such as railroad grade crossings, street parking, and intersection improvements to accommodate bus movements.
- Pace requests participation in the planning development and design of the proposed station facilities served by both fixed route and Regional ADA Paratransit services. Design should include sufficient bays to accommodate Pace and CTA bus routes, Regional ADA Paratransit, operator facilities, passenger information as well as bus priority access such as Transit Signal Priority or bus activated signals to allow buses to enter/exit the terminal with minimal congestion.

We look forward to participating in this regional planning process.

Keeping Greater Roseland Alive!

To: **Jeffrey Busby, General Manager, Strategic Planning**
Chicago Transit Authority

Email: RedExtension@transitchicago.com

From: **The Red line Oversight Committee (ROC) of Developing Communities Project**

Subject: **Red Line Extension EIS Scoping Comments**

Date: **Oct. 27, 2009**

The environmental analysis for the Locally Preferred Alternative (LPA) recommended by the CTA and approved by the Chicago Transit Board represents a significant milestone in the five-year organizing and advocacy effort to make the Red Line Extension a reality. The 13 scoping issues listed in the CTA Red Line Extension "Environmental Impact Statement Scoping Information" brochure (Sept. 2009) are issues and areas of concern for the far south side Greater Roseland community.

Developing Communities Project (DCP) is proud to have spear-headed community efforts to bring this important project to the attention of public officials and regional planners. DCP sees its role and function in the current phase of planning and evaluation for the Environmental Impact Statement (EIS) and Preliminary Engineering (PE) as one of highlighting critical issues that planners and decision-makers need to seriously consider in evaluating the cost-effectiveness and equity consideration for pursuing the LPA. This is especially important in view of the fact that the CTA Red Line Extension LPA has been demonstrated by DCP to be the route, from 95th Street to 130th Street, that is overwhelmingly favored by the Greater Roseland community.

For that reason, DCP and its Red line Oversight Committee (ROC) are submitting the following EIS Scoping Comments:

1) A major concern that we have is with the environmental foot print that the proposed creation of park-and-rides at each of the four station stops will have. The RTA has reservations about making more park-and-rides for automobile traffic. There is also the issue of over-capacity in residential areas. Since there exists legislation that allows church parking lots in the vicinity of train stops to offer their facilities as park-and-rides, and Metra has been doing this for some time, CTA should consider scoping the impact of church parking lots instead of the construction of new park-and-rides in the vicinity of the four station stops of the Extension. This would have the added bonus of reducing the line item in the project budget for park-and-rides and make the Extension more cost-effective.

1) Because the environmental analysis for rail lines looks at the impact on traffic patterns and congestion years into the future, DCP believes that the LPA that extends to 130th Street has the greatest impact on mitigating traffic congestion feeding in from the south suburban and collar counties. The other alternatives to the LPA, still under consideration, do not meet this criterion in any significant way.

2) DCP would urge the CTA to evaluate and forecast the impact of the LPA on air quality levels in comparison to the other alternatives.

3) DCP urges the CTA environmental analysis to measure and forecast the LPA's impact on increasing labor productivity as a result of mitigating car congestion and reducing travel times to work for residents of the far south side of Chicago and south suburbs and collar counties.

4) According to the CTA, in its press release, "CTA Celebrates Earth Week," a fully loaded 8-car train eliminates 1,000 cars from our highways, thus mitigating congestion, reducing travel times to work, and improving air quality. How will the CTA operationalize this metric in assessing the impact of the Red Line Extension?

5) DCP urges the CTA to calculate the wait-times of riders at the proposed station stops of the Extension against the wait-times of passengers for the other alternatives under consideration, including the status quo and the "no build" option. This is important because the longer riders wait past 15 minutes the more turned off to public transportation they become. On the positive side, the calculation or forecast of wait-times can provide an estimation of potential riders who would take advantage of public transportation.

6) According to the RTA's Campaign for Better Transit, "Basic Facts about Public Transportation in the Chicago Metropolitan Area," 77% of residents with cars decide to use pubic transit. DCP urges the CTA, in its environmental analysis, to estimate the impact of the Red Line Extension on this metric for the far south side, south suburbs and collar counties.

7) Can the estimated reduction in air pollution due the impact of the Red Line Extension be made a collateral cost-effective benefit given the poor air quality on the far south side and south suburbs due to the area, especially around Altgeld Gardens, being the site of the City's toxic waste disposal site? In other words, what are the ramifications of the Red Line Extension's reduction of automobile congestion and exhausts in an area that is already identified as having the poorest air quality in the metropolitan area? [NB: This is a "superfund" type of issue that raises the question of transit impacts on major polluters in the area, i.e., what are the trade-offs presented by a major transportation project for a mixed residential and industrial landscape?]

8) DCP urges the CTA to investigate the impact on the construction of the Red Line Extension LPA on brown fields abatement, especially around the 130th Street station at Altgeld Gardens, and the proposed new train yard.

9) DCP urges the CTA to investigate thoroughly both the noise impact of the LPA and the "best available" technologies needed to significantly mitigate the possible noise problems associated with the Red Line Extension.

10) Noise is the greatest environmental disturbance caused by public transit. However, in the case of the Red Line Extension LPA, the project right-away along the UPRR is already the cause of significant noise disturbance. In support of local homeowners and their concerns about additional noise pollution, DCP urges the CTA to do a scoping analysis of the current noise levels caused by the UPRR.

11) DCP also urges the CTA to make, as part of its scoping analysis of potential noise disturbance caused by the Extension, a full-scale investigation of the "best available" and "best practicable" noise mitigation technologies for the Extension.

12) The role transportation can play in revitalizing and supporting underserved communities is recognized by the U.S. Department of Transportation (DOT) and the Federal Transit Administration (FTA) in their efforts to include environmental justice language in program and funding priorities. In addition to safety and mobility being the U.S. Department of Transportation's two top priorities, DOT describes 3 fundamental environmental justice principles to be relevant for transportation planning and to the mission of the agency. Environmental Justice Principles for transportation programs include: 1) To avoid, minimize, or mitigate disproportionately high and adverse human health and environmental effects, including social and economic effects, on minority and low-income populations. 2) To prevent the denial of, reduction in, or significant delay in the receipt of benefits by minority and low-income populations. 3) Ensure full participation by all potentially affected communities. How does the CTA intend to insure that these principles are adhered to? How does the CTA intend to make the prevention of denial of, reduction in and delay in "receipt of benefits by minority and low-income populations," e.g., Altgeld Gardens, a priority criterion for the EIS of the Red Line Extension.

13) Livability Principles for transportation, housing and environmental programs include: 1) Provide more transportation choices, 2) Promote equitable affordable housing, 3) Enhance economic competitiveness, 4) Support existing communities, 5) Coordinate policies and leverage investment, 6) Value communities and neighborhoods. How does the CTA plan to make these environmental goals operational in the environmental analysis of the Red Line Extension?

14) What is the CTA's employment model for measuring the potential benefits to working populations on the far south side, south suburbs and collar counties afforded by the Red Line Extension?

15) Does the CTA intend to prioritize the impact of transit investment on job creation and increasing employment opportunities, in accordance with the environmental justice criterion of preventing the denial of, reduction in and delay in "receipt of benefits by minority and low-income populations," in its environmental impact analysis?

In conclusion, Developing Communities Project and its Red line Oversight Committee would like to express its appreciation to the Chicago Transit Authority for its serious consideration of the issues that we have brought to your attention. We look forward to your response as the process of drafting the Environmental Impact Statement for the Red Line Extension proceeds.

With sincerest regards,

Gwendolyn M. Rice

Please comment on the proposed alternatives, the purpose and need for the project, the proposed topics of evaluation and the potential impacts and mitigation measures to be considered. Comments must be submitted by the close of business on October 27, 2009.

I support the extension of the CTA Red Line using the Union Pacific Rail Road (UPRR) route. I support the position that the Red Line extension must reach the Altgeld Gardens/ Calumet River area at 130th Street and that every possible engineering design concept must be examined to ensure the full extension of the Red Line from 95th Street to 130th Street. This will insure mass transit access to a transit dependent population, south suburban communities and nearby industries.

I think citizens near Altgeld Gardens and 130th st. Should have access to CTA red line. It will speed up their travels. They will have access to the down-town area without going thru transferring to buses and walking.

Shirley Hill

Please comment on the proposed alternatives, the purpose and need for the project, the proposed topics of evaluation and the potential impacts and mitigation measures to be considered. Comments must be submitted by the close of business on October 27, 2009.

I support the extension of the CTA Red Line using the Union Pacific Rail Road (UPRR) route. I support the position that the Red Line extension must reach the Altgeld Gardens/ Calumet River area at 130th Street and that every possible engineering design concept must be examined to ensure the full extension of the Red Line from 95th Street to 130th Street. This will insure mass transit access to a transit dependent population, south suburban communities and nearby industries.

Scoping comments may be submitted via mail, e-mail, fax or the project website with attention to: Jeffrey Busby, General Manager, Strategic Planning, Chicago Transit Authority, P.O. Box 7602, Chicago, IL 60680-7602. **Fax:** (312)681-4297, **Email:** RedExtension@transitchicago.com, **Website:** www.transitchicago.com/RedEIS, **Customer Information:** 1-888-YOUR-CTA (1-888-968-7282), **Hearing & Speech Impaired:** 1-888-CTA-TTY1 (1-888-282-6891), **Transit Information:** 836-7000 from any local area code **RTA TTY:** 312-836-4949

Please comment on the proposed alternatives, the purpose and need for the project, the proposed topics of evaluation and the potential impacts and mitigation measures to be considered. Comments must be submitted by the close of business on October 27, 2009.

I support the extension of the CTA Red Line using the Union Pacific Rail Road (UPRR) route. I support the position that the Red Line extension must reach the Altgeld Gardens/ Calumet River area at 130th Street and that every possible engineering design concept must be examined to ensure the full extension of the Red Line from 95th Street to 130th Street. This will insure mass transit access to a transit dependent population, south suburban communities and nearby industries.

Please comment on the proposed alternatives, the purpose and need for the project, the proposed topics of evaluation and the potential impacts and mitigation measures to be considered. Comments must be submitted by the close of business on October 27, 2009.

I support the extension of the CTA Red Line using the Union Pacific Rail Road (UPRR) route. I support the position that the Red Line extension must reach the Altgeld Gardens/ Calumet River area at 130th Street and that every possible engineering design concept must be examined to ensure the full extension of the Red Line from 95th Street to 130th Street. This will insure mass transit access to a transit dependent population, south suburban communities and nearby industries.

Scoping comments may be submitted via mail, e-mail, fax or the project website with attention to: Jeffrey Busby, General Manager, Strategic Planning, Chicago Transit Authority, P.O. Please comment on the proposed alternatives, the purpose and need for the project, the proposed topics of evaluation and the potential impacts and mitigation measures to be considered. Comments must be submitted by the close of business on October 27, 2009.

I support the extension of the CTA Red Line using the Union Pacific Rail Road (UPRR) route. I support the position that the Red Line extension must reach the Altgeld Gardens/ Calumet River area at 130th Street and that every possible engineering design concept must be examined to ensure the full extension of the Red Line from 95th Street to 130th Street. This will insure mass transit access to a transit dependent population, south suburban communities and nearby industries.

Please comment on the proposed alternatives, the purpose and need for the project, the proposed topics of evaluation and the potential impacts and mitigation measures to be considered. Comments must be submitted by the close of business on October 27, 2009.

I support the extension of the CTA Red Line using the Union Pacific Rail Road (UPRR) route. I support the position that the Red Line extension must reach the Altgeld Gardens/ Calumet River area at 130th Street and that every possible engineering design concept must be examined to ensure the full extension of the Red Line from 95th Street to 130th Street. This will insure mass transit access to a transit dependent population, south suburban communities and nearby industries. Teresa Williams

Please comment on the proposed alternatives, the purpose and need for the project, the proposed topics of evaluation and the potential impacts and mitigation measures to be considered. Comments must be submitted by the close of business on October 27, 2009.

I support the extension of the CTA Red Line using the Union Pacific Rail Road (UPRR) route. I support the position that the Red Line extension must reach the Altgeld Gardens/ Calumet River area at 130th Street and that every possible engineering design concept must be examined to ensure the full extension of the Red Line from 95th Street to 130th Street. This will insure mass transit access to a transit dependent population, south suburban communities and nearby industries.

Please comment on the proposed alternatives, the purpose and need for the project, the proposed topics of evaluation and the potential impacts and mitigation measures to be considered. Comments must be submitted by the close of business on October 27, 2009.

I support the extension of the CTA Red Line using the Union Pacific Rail Road (UPRR) route. I support the position that the Red Line extension must reach the Altgeld Gardens/ Calumet River area at 130th Street and that every possible engineering design concept must be examined to ensure the full extension of the Red Line from 95th Street to 130th Street. This will insure mass transit access to a transit dependent population, south suburban communities and nearby industries.

Scoping comments may be submitted via mail, e-mail, fax or the project website with attention to: Jeffrey Busby, General Manager, Strategic Planning, Chicago Transit Authority, P.O. Please comment on the proposed alternatives, the purpose and need for the project, the proposed topics of evaluation and the potential impacts and mitigation measures to be considered. Comments must be submitted by the close of business on October 27, 2009.

I support the extension of the CTA Red Line using the Union Pacific Rail Road (UPRR) route. I support the position that the Red Line extension must reach the Altgeld Gardens/ Calumet River area at 130th Street and that every possible engineering design concept must be examined to ensure the full extension of the Red Line from 95th Street to 130th Street. This will insure mass transit access to a transit dependent population, south suburban communities and nearby industries.

Please comment on the proposed alternatives, the purpose and need for the project, the proposed topics of evaluation and the potential impacts and mitigation measures to be considered. Comments must be submitted by the close of business on October 27, 2009.

I support the extension of the CTA Red Line using the Union Pacific Rail Road (UPRR) route. I support the position that the Red Line extension must reach the Altgeld Gardens/ Calumet River area at 130th Street and that every possible engineering design concept must be examined to ensure the full extension of the Red Line from 95th Street to 130th Street. This will insure mass transit access to a transit dependent population, south suburban communities and nearby industries.

Scoping comments may be submitted via mail, e-mail, fax or the project website with attention to: Jeffrey Busby, General Manager, Strategic Planning, Chicago Transit Authority, P.O. Please comment on the proposed alternatives, the purpose and need for the project, the proposed topics of evaluation and the potential impacts and mitigation measures to be considered. Comments must be submitted by the close of business on October 27, 2009.

I support the extension of the CTA Red Line using the Union Pacific Rail Road (UPRR) route. I support the position that the Red Line extension must reach the Altgeld Gardens/ Calumet River area at 130th Street and that every possible engineering design concept must be examined to ensure the full extension of the Red Line from 95th Street to 130th Street. This will insure mass transit access to a transit dependent population, south suburban communities and nearby industries.

Please comment on the proposed alternatives, the purpose and need for the project, the proposed topics of evaluation and the potential impacts and mitigation measures to be considered. Comments must be submitted by the close of business on October 27, 2009.

I support the extension of the CTA Red Line using the Union Pacific Rail Road (UPRR) route. I support the position that the Red Line extension must reach the Altgeld Gardens/ Calumet River area at 130th Street and that every possible engineering design concept must be examined to ensure the full extension of the Red Line from 95th Street to 130th Street. This will insure mass transit access to a transit dependent population, south suburban communities and nearby industries.

Scoping comments may be submitted via mail, e-mail, fax or the project website with attention to: Jeffrey Busby, General Manager, Strategic Planning, Chicago Transit Authority, P.O. Please comment on the proposed alternatives, the purpose and need for the project, the proposed topics of evaluation and the potential impacts and mitigation measures to be considered. Comments must be submitted by the close of business on October 27. 2009.

The Key MEASURE FOR consideration in This MATTER is the TRANSIT RIDERS: how the CTA CAN BE MORE USER FRIENDLY & helpful to those persons who ARE TRANSIT disadvantaged.

Clearly, the Red Line must be extended & AVAILABLE to those with low incomes, without cars OR without employment because they ARE TRANSIT disadvantaged.

It is CRITICAL FOR The CTA Line to extend to 130th St to insure that young & old have access to Chicago's amenities - the HAROLD WASHINGTON LIBRARY, the Millenium Park, The Cultural Center - that ARE SO TOTALLY accessible to walking and high wealth communities.

It is important for transit to be equitable. This line will help (not completely solve) to mitigate against The glaring transit inequities on Chicago's FAR South side.

Chicago Transit Authority
P.O. Box 7602
Chicago, IL 60680-7602

Dear Mr. Busby:

In response to the *Environmental Impact Statement Scoping Information* regarding *Connecting 95th Street Station to 130th Street,* The Chicago Housing Authority (CHA) would like to express strong support for the Red Line Extension Locally Preferred Alternative.

This alternative extension would improve public transportation and citywide accessibility for residents and workers of the South Side. Particularly, this extension would allow greater public transportation and a Red Line stop near the Altgeld Gardens residential development which is located on the far South Side near the Riverdale community. The 190-acre Altgeld Gardens is comprised of 17 blocks of 225 two-story row houses with 1,953 family units and its full rehabilitation is scheduled to be completed in 2014. The CHA would like to add that the Red Line Extension Locally Preferred Alternative would have a tremendous positive impact for the families living at Altgeld Gardens who would certainly benefit from utilizing this proposed extension.

The CHA looks forward to this Chicago Transit Authority targeted project and hopes that we can be of support throughout the process of the Red Line Extension.

Sincerely,

Lewis A. Jordan
Chief Executive Officer

Even though there was one other option presented at the Sept. 22nd, Scoping Mee
-cant see the purpose being fulfilled using it or the HRT Alternativeroute. Your goals as
stated on page 11 appears to be more efficiently implimented by the Locally Preferred Alt
West and South side of the exsisting track. That being said, What is the distance fro
the track of property in need of occupancy removal? Where on the time-line would
hose individuals be contacted? How would these persons be contacted? Who (what
division of Management) will be responsible for those notifications? Will the Engineers now
be aware + take under consideration the ability or inability of homes that structurally coul
not withstand ⓐ the building/construction affects (the shifting of landscape (consequently home structures
ⓑ upon opening the rail-traffic.
I think the age of the structures must be taken into consideration not only
distance.
I commend you on your objectives - knowing how very much this new system effe
s needed and I hope an open and fair Communication Line will Continue throughout the Project at

Please comment on the proposed alternatives, the purpose and need for the project, the proposed topics of evaluation and the potential impacts and mitigation measures to be considered. Comments must be submitted by the close of business on October 27, 2009.

I support the extension of the CTA Red Line using the Union Pacific Rail Road (UPRR) route. I support the position that the Red Line extension must reach the Altgeld Gardens/ Calumet River area at 130th Street and that every possible engineering design concept must be examined to ensure the full extension of the Red Line from 95th Street to 130th Street. This will insure mass transit access to a transit dependent population, south suburban communities and nearby industries.

Scoping comments may be submitted via mail, e-mail, fax or the project website with attention to: Jeffrey Busby, General Manager, Strategic Planning, Chicago Transit Authority, P.O. NEIGHBORHOODS Alive!
BUILDING CHICAGO TOGETHER

October 30, 2009

Mr. Richard L. Rodriguez, President
Mr. Jeffrey Busby, General Manager, Strategic Planning
Chicago Transit Authority
P.O. Box 7602
Chicago, IL 60680-7602

Dear Messrs. Rodriguez and Busby:

The Department of Environment (DOE) appreciates the opportunity to comment on the proposed extension of the Chicago Transit Authority (CTA) Red and Orange Lines. We are supportive of both projects and the increased service to currently under-supported communities.

Three sections follow; the first is a list that applies to both projects, the second focuses on the Red Line, and the third on the Orange Line.

BOTH PROJECTS
Please evaluate:

- Recycling opportunities at stations and parking areas
- Alternative energy options including solar, solar thermal, wind and more to provide electricity and heating / cooling where needed
- Opportunities to install solar arrays (on rooftops, large expanses, etc.) to return energy to the grid
- Reduction of light pollution through the use of downward-facing lighting
- Compliance with the city's stormwater ordinance, including using bioswales, rain barrels and other methods to reduce the first flush of water into the sewer system
- Native landscapes requiring little to no irrigation
- Green roofs on any facilities
- Bicycle access and parking
- Permeable paving for the Park-N-Ride areas
- Preferred parking for fuel-efficient vehicles
- Charging stations for electric vehicles
- The City's new Soil and Rubble Reuse Intergovernmental Agreement applicability – extensive reuse of materials during demolition and construction could be possible
- Impacts to wildlife or other important natural resources

CHICAGO WORKS TOGETHER

RED LINE
DOE will be constructing the Ford Calumet Environmental Center, a 38,000 square foot environmental education facility near 130th and Torrence in Chicago. We are supportive of a joint Metra / CTA station at 115th Street and are very interested in the possibility of an intermodal connection between NicTD/South Shore Line and CTA at 130th Street. These joint stations would allow residents from Indiana and the suburbs to easily gain access to our Center. We would also invite discussion around a bus turnaround at the Center for the 130th and Torrence buses or other buses with similar routes.

ORANGE LINE
Of particular concern to DOE are issues relating to neighborhood compatibility and environmental justice, primarily in relation to historical and/or privately owned parcels that may need to be acquired for the project. DOE would also be interested in a detailed evaluation of noise and vibration, including additive effects associated with Midway airport operations, to determine how such issues will affect neighboring properties.

We offer our support and assistance with any of our comments as appropriate. Thank you for the opportunity to comment on these important projects.

Sincerely,

Suzanne Malec-McKenna
Commissioner

Mr. Jeffrey Busby
General Manager, Strategic Planning
Chicago Transit Authority
RedExtension@transitchicago.com
OrangeExtension@transitchicago.com

Dear Mr. Busby:

I am writing in response to your request for comments regarding the environmental reviews that will take place pertinent to the potential expansions of the Red and Orange Lines of the Chicago Transit Authority.

For both projects, the City of Chicago's Department of Streets and Sanitation (DSS) would like the review committee to consider the following comments and concerns regarding the expansions during the environmental review process:

1. The location of any street lights that will need to be removed or relocated as a result of the new lines;
2. An analysis of the affect these elevated concrete supports will have on street level lighting and any steps that will be taken to supplement street lighting in these areas, i.e. CTA-provided lighting on the underside of the elevated line;
3. The location of any public way trees that will need to be removed as a result of the new lines or the construction activity and a replacement strategy for those lost trees;
4. The level of assistance the CTA expects to request from DSS for services such as street "No Parking" postings and the towing of illegally parked vehicles during the construction phase of these projects;
5. The creation of a rodent abatement plan for the affected land which includes required sign-offs by the DSS's Bureau of Rodent Control prior to construction;
6. A plan for the proper storage, removal and recycling of all construction and demolition debris in accordance with all City of Chicago ordinances; and
7. A commitment to having platform level recycling containers and space at street level for the storage of recyclables prior to being separately collected from the garbage.

Thank you for your consideration of these issues

Sincerely,
(SIGNED)

Chicago, IL 60680-7602

Dear Mr. Busby:

In response to the *Environmental Impact Statement Scoping Information* regarding *Connecting 95th Street Station to 130th Street,* The Chicago Housing Authority (CHA) would like to express strong support for the Red Line Extension Locally Preferred Alternative.

This alternative extension would improve public transportation and citywide accessibility for residents and workers of the South Side. Particularly, this extension would allow greater public transportation and a Red Line stop near the Altgeld Gardens residential development which is located on the far South Side near the Riverdale community. The 190-acre Altgeld Gardens is comprised of 17 blocks of 225 two-story row houses with 1,953 family units and its full rehabilitation is scheduled to be completed in 2014. The CHA would like to add that the Red Line Extension Locally Preferred Alternative would have a tremendous positive impact for the families living at Altgeld Gardens who would certainly benefit from utilizing this proposed extension.

The CHA looks forward to this Chicago Transit Authority targeted project and hopes that we can be of support throughout the process of the Red Line Extension.

Sincerely,

Lewis A. Jordan
Chief Executive Officer

BUREAU OF PATROL **1 October 2009**

TO: Jeffrey Busby
General Manager
Strategic Planning
Chicago Transit Authority

FROM: Mark Harmon
Commanding Officer
Bureau of Patrol Administration

SUBJECT: CTA Extension Projects

Bureau of Patrol is listing the following concerns/issues to be addressed in regards to the Red and Orange line extension projects:

- Federal funding for an overtime initiative similar to the Dan Ryan extension project. Overall security for the project will over burden regular patrol duties. Site and personnel security should be covered separately from day to day operations.

- Remote and somewhat concealed access points and locations pose security issues.

- Additional traffic issues need to be addressed with proposed right of way going to CTA. There will also be additional vehicles being utilized to begin the shuttle service to proposed new destinations.

- More Chicago Police Department members will need to be rail certified with the proximity of the rail system to the designated patrol areas.

- Proposed expansion of the 95th St terminal poses many traffic and security issues. Currently the terminal is one of the busiest rail locations for police service. This would be greatly affected by reduced parking and increased foot and vehicular traffic.

Planning and Development
Chicago Transit Authority
567 West Lake Street
Chicago, IL 60661-1498

Dear Mr. Paquet:

We have reviewed the information concerning an Environmental Impact Statement project for the proposed Red Line Extension to serve the South Suburban residents. This project also includes improvements to the 95th Street Station terminal.

The Agency has no objections to the project; however a construction site activity stormwater NPDES permit will be required from the Division of Water Pollution Control. Also, please contact The U. S. Army Corps of Engineers for any permit requirements if there are any stream crossings that require dredge and fill activities in the waterway.

If you have need for an Environmental Review in the future, please submit your information to:
Illinois Environmental Protection Agency, Deputy Director's Office/MC #1,
PO Box 19276, Springfield, Illinois 62794-9276, **ATTN: DiAnne Schuerman**

Sincerely,

Subject: Illinois State Police concerns

As we discussed in the Scoping meeting on September 23, 2009. Below is details a few concerns we had and would like them looked at during the preliminary phase:

FIRST RESPONDERS

Will the construction area be easily accessible for First Responders to respond to any type of emergency? With the tracks being elevated, will there be an easy on/off for personnel?

SECURITY

If the Contractor desires additional police officer services of Illinois State Police (ISP), District Chicago, for enforcement, traffic control, and/or security, ISP personnel will, as available, provide police services on a hireback basis. During this time, ISP officers will provide a visible State Police presence, provide general police services and take enforcement action as appropriate in and around the site of the program. We will govern all areas on the expressways or on state owned property. To secure the above, the Contractor would have to sign a binding contract detailing all the specifics with the State of Illinois.

If you should have any questions or need additional information, please do not hesitate to contact me.

Respectfully,

Lieutenant Tony Lupo

To: Red Extension
Subject: Red line EIS scoping comments

Pace scoping comments regarding CTA Red Line Extension Environmental Impact Statement

Thank you for the opportunity to review and comment on the scoping of the Environmental Impact Statement for the Red Line extension. Below are comments regarding the proposed project alternatives and potential environmental impacts relating to the proposed extension between 95th Street Station and 130th Street.

- Pace supports the rail extension of the Red Line from the current terminus at 95th Street Station to 130th Street
- In compliance with the Illinois Auditor General's recommendation to reduce CTA & Pace overlapping service and provide greater suburban market coverage area, Pace intends to restructure various south suburban routes operating on Halsted and King Drive which now serve the Red Line 95th Street Station. Additional planning development and review would be required to determine the most optimal station(s) to serve on either alignment.
- Arterial roadway access to/from the proposed station(s) served by connecting bus services will require further review including issues such as railroad grade crossings, street parking, and intersection improvements to accommodate bus movements.
- Pace requests participation in the planning development and design of the proposed station facilities served by both fixed route and Regional ADA Paratransit services. Design should include sufficient bays to accommodate Pace and CTA bus routes, Regional ADA Paratransit, operator facilities, passenger information as well as bus priority access such as Transit Signal Priority or bus activated signals to allow buses to enter/exit the terminal with minimal congestion.

We look forward to participating in this regional planning process.

The Agency has no objections to the project; however a construction site activity stormwater NPDES permit will be required from the Division of Water Pollution Control. Also, please contact The U. S. Army Corps of Engineers for any permit requirements if there are any stream crossings that require dredge and fill activities in the waterway.

If you have need for an Environmental Review in the future, please submit your information to:
Illinois Environmental Protection Agency, Deputy Director's Office/MC #1,
PO Box 19276, Springfield, Illinois 62794-9276, **ATTN: DiAnne Schuerman**

Sincerely,

Lisa Bonnett

Subject: Illinois State Police concerns

As we discussed in the Scoping meeting on September 23, 2009. Below is details a few concerns we had and would like them looked at during the preliminary phase:

FIRST RESPONDERS

Will the construction area be easily accessible for First Responders to respond to any type of emergency? With the tracks being elevated, will there be an easy on/off for personnel?

SECURITY

If the Contractor desires additional police officer services of Illinois State Police (ISP), District Chicago, for enforcement, traffic control, and/or security, ISP personnel will, as available, provide police services on a hireback basis. During this time, ISP officers will provide a visible State Police presence, provide general police services and take enforcement action as appropriate in and around the site of the program. We will govern all areas on the expressways or on state owned property. To secure the above, the Contractor would have to sign a binding contract detailing all the specifics with the State of Illinois.

If you should have any questions or need additional information, please do not hesitate to contact me.

Respectfully,

Lieutenant Tony Lupo

Subject: Red line EIS scoping comments

Pace scoping comments regarding CTA Red Line Extension Environmental Impact Statement

Thank you for the opportunity to review and comment on the scoping of the Environmental Impact Statement for the Red Line extension. Below are comments regarding the proposed project alternatives and potential environmental impacts relating to the proposed extension between 95th Street Station and 130th Street.

- Pace supports the rail extension of the Red Line from the current terminus at 95th Street Station to 130th Street
- In compliance with the Illinois Auditor General's recommendation to reduce CTA & Pace overlapping service and provide greater suburban market coverage area, Pace intends to restructure various south suburban routes operating on Halsted and King Drive which now serve the Red Line 95th Street Station. Additional planning development and review would be required to determine the most optimal station(s) to serve on either alignment.
- Arterial roadway access to/from the proposed station(s) served by connecting bus services will require further review including issues such as railroad grade crossings, street parking, and intersection improvements to accommodate bus movements.
- Pace requests participation in the planning development and design of the proposed station facilities served by both fixed route and Regional ADA Paratransit services. Design should include sufficient bays to accommodate Pace and CTA bus routes, Regional ADA Paratransit, operator facilities, passenger information as well as bus priority access such as Transit Signal Priority or bus activated signals to allow buses to enter/exit the terminal with minimal congestion.

We look forward to participating in this regional planning process.

General Manager, Strategic Planning
Chicago Transit Authority
P.O. Box 7602
Chicago, IL 60680-7602

Dear Mr. Busby:

Subject: Environmental Impact Statement Scoping for the CTA Red Line Extension

Reference is made to your interagency scoping meeting on September 24, 2009, concerning the subject matter. The Metropolitan Water Reclamation District of Greater Chicago (District) has the following comments for the scoping process:

- Aerial photos of the Locally Preferred Alternative shown at the meeting indicate the proposed alignment running along the Union Pacific Railroad (UPRR) at grade adjacent to District property. The District requires access between the Calumet Water Reclamation Plant to the west of Cottage Grove Avenue and its facilities to the east of Cottage Grove Avenue. District access between the two facilities will have to be modified or reconstructed as part of the project.

- The proposed alternative for the station at the end of the line south of 130th Street is adjacent to District property between 130th Street and 130th Avenue and west of the station. Depending on the location of parking, etc., a request to lease or acquire District property may be required.

- The location for the proposed CTA station north of 130th Street is entirely on District property, some of which may be considered wetland. Also, it appears that the rerouted Cottage Grove Avenue utilizes the District road within the plant boundaries. The District understands that the draft plans are preliminary, but we will have to do a complete evaluation as plans are further developed to determine potential impact on the District.

- We recommend an odor study be conducted early in the environmental review process for impacts on the proposed CTA facilities. The area of greatest concern is the final CTA station along 130th Street, which is directly adjacent to the Calumet Water Reclamation Plant.

- The proposed alignment crosses the District's 17'6"x14'0" Calumet Intercepting Sewer 6 just east of Indiana Avenue. Attached are Sheets 1 and 5 of this contract. This intercepting sewer should be placed on all future Red Line Extension plans.

Questions may be referred to Joe Schuessler, 312-751-3236.

Very truly yours,

Joseph Sobanski

Joseph P. Sobanski

Limited English Proficiency Analysis (July 2009)

CWC Transit Group

Memorandum

To: CTA

From: CWC Transit Group

Date: July 13, 2009

Subject: Red Line Extension Limited English Proficiency Assessment

Upon further analysis of the Limited English Proficiency (LEP) needs of the CTA Red Line Extension Project Area, we have determined that public outreach materials should be prepared in both English and Spanish.

Looking at census data within each tract adjacent to the Locally Preferred Alternative (LPA) we see that there are several tracts where over 35% of the citizens speak Spanish/Spanish Creole. Construction of the Red Line Extension Project can have large impacts on the community, even more so on the properties adjacent to the LPA. The CTA needs to ensure that every citizen potentially affected by this project is made aware of possible impacts on their neighborhood.

Analysis was conducted at the tract level by specifically selecting those tracts adjacent to the LPA Right of Way (ROW). Refer to the attached LEP Baseline Report (Enclosure 1) and the corresponding Census Tract map (Enclosure 2) for detailed data on the specific tracts and languages used within each.

Enclosures:

1. ***LEP Baseline Report***
2. ***Map of Census Tracts along LPA ROW***

cc: ***Melissa Peters***

Limited English Proficiency (LEP) Baseline Report

CTA Red Line

Executive Order 13166 "Improving Access to Services for Persons with Limited English Proficiency" requires all recipients of federal funds to provide meaningful access to persons who are limited in their English proficiency (LEP). The United States (U.S.) Department of Justice defines LEP individuals as those "who do not speak English as their primary language and who have a limited ability to read, write, speak, or understand English" (67 FR 41459). Data about LEP populations was gathered in the U.S. Census 2000. For data analysis purposes, the Census divides the states of the United States into counties and divides counties into tracts.

Within area tracts, Census data record the presence of persons who describe their ability to speak English as less than "Very Well." The table below shows the percentages of adults who speak English less than "Very Well" by language category. Additionally, 175 households or 1.0% of households within area tracts reported to the Census that their household was linguistically isolated, meaning that all household members over the age of fourteen had at least some difficulty with English. Thus, Census data indicate the presence of LEP populations.

Table. Census Data: Percent of Adult Speakers Who Speak English Less than Very Well*

Census Geographies	Total Adult Population	Percent of Adult Speakers Who Speak English Less than Very Well			
		Spanish Language Speakers	Other Indo European Language Speakers	Asian and Pacific Island Language Speakers	Other Language Speakers
Tracts					
Tract 4906.00 Cook County	1,331	0.6%	0.0%	0.5%	0.0%
Tract 4907.00 Cook County	2,709	0.6%	0.3%	0.0%	0.2%
Tract 4910.00 Cook County	4,356	0.7%	0.4%	0.4%	0.0%
Tract 4911.00 Cook County	3,986	0.7%	0.0%	0.0%	0.0%
Tract 4912.00 Cook County	1,949	0.3%	0.3%	0.0%	0.0%
Tract 4913.00 Cook County	2,470	1.5%	0.3%	0.0%	0.0%
Tract 5104.00 Cook County	33	15.2%	0.0%	0.0%	0.0%
Tract 5301.00 Cook County	1,993	21.9%	0.0%	0.0%	0.0%
Tract 5302.00 Cook County	4,577	1.0%	0.0%	0.7%	0.0%

Tract 5305.00 Cook County	10,336	0.6%	0.7%	0.0%	0.3%
Tract 5306.00 Cook County	2,699	0.7%	1.2%	0.0%	0.0%
Tract 5401.00 Cook County	5,305	2.8%	0.0%	0.0%	0.0%

Data Source: United States Census 2000 (Table P19) as of February 9, 2008 for persons age 18 and older.

* The data on ability to speak English represent the Census respondent's own perception about his ability to speak English (United States Census 2000 Metadata).

Since LEP is partially defined as a limited ability to read and write English, literacy data were also consulted. Indirect literacy estimates for adults were calculated by the National Center for Education Statistics based on 2003 survey data for states and counties. None of the geographies in study area meet the requirements to be included in the National Institute for Literacy study; thus, literacy data is not available. In conclusion, the data indicate the likelihood of LEP populations in the area.

To determine the languages of the LEP populations, Census data were consulted for project area tracts. The table below details the top five languages spoken by the total adult population (LEP and non-LEP) for each tract.

Table. Census Data: Top Five Languages Spoken by the Adult Population

Census Geographies	**Language 1**	**Language 2**	**Language 3**	**Language 4**	**Language 5**
Tracts					
Tract 4906.00 Cook County	English 93.2%	Spanish/Spanish Creole 2.3%	Tagalog 2.3%	French (Patois, Cajun) 1.8%	Korean 0.4%
Tract 4907.00 Cook County	English 96.4%	Spanish/Spanish Creole 2.1%	German 0.6%	Hebrew 0.5%	Korean 0.4%
Tract 4910.00 Cook County	English 96.9%	Spanish/Spanish Creole 2.2%	Tagalog 0.4%	French (Patois, Cajun) 0.4%	Korean 0.2%
Tract 4911.00 Cook County	English 97.7%	Spanish/Spanish Creole 1.3%	Japanese 0.4%	German 0.3%	Italian 0.2%
Tract 4912.00 Cook County	English 96.8%	French (Patois, Cajun) 1.0%	Spanish/Spanish Creole 0.9%	Tagalog 0.8%	German 0.3%
Tract 4913.00 Cook County	English 96.8%	Spanish/Spanish Creole 2.1%	French Creole 0.9%	French (Patois, Cajun) 0.3%	-
Tract 5104.00 Cook County	English 60.6%	Spanish/Spanish Creole 39.4%	-	-	-
Tract 5301.00 Cook County	English 59.5%	Spanish/Spanish Creole	Other Slavic languages	German 0.6%	Italian 0.4%

		38.9%	0.7%		
Tract 5302.00 Cook County	English 96.2%	Spanish/Spanish Creole 2.6%	Tagalog 0.7%	German 0.2%	Other Pacific Island languages 0.2%
Tract 5305.00 Cook County	English 94.3%	Spanish/Spanish Creole 2.1%	French (Patois, Cajun) 1.1%	Arabic 0.8%	German 0.6%
Tract 5306.00 Cook County	English 96.6%	Spanish/Spanish Creole 1.7%	Polish 1.0%	Russian 0.3%	French (Patois, Cajun) 0.3%
Tract 5401.00 Cook County	English 95.1%	Spanish/Spanish Creole 4.8%	Italian 0.1%	-	-
Data Source: United States Census 2000 (Table PCT10) as of February 9, 2008.					

Therefore, the tracts data does not indicate the presence of LEP language groups that exceed the Department of Justice's Safe Harbor threshold of 5% or 1,000 persons. [However, the following measures will be taken to ensure LEP persons meaningful access: enter any measures to be taken to ensure meaningful access if applicable]. Thus, the requirements of Executive Order 13166 appear to be satisfied.

AA - Alternatives Analysis
CTA - Chicago Transit Authority
EIS - Environmental Impact Statement
FTA - Federal Transit Administration
HRT - Heavy Rail Transit
LEP - Limited English Proficiency
LPA - Locally Preferred Alternative
NEPA - National Environmental Policy Act
RLE - Red Line Extension
TSM - Transportation Systems Management
UPRR - Union Pacific Railroad

SECTION 1
OVERVIEW

Red Line Extension Project

The Chicago Transit Authority (CTA) is proposing to make transportation improvements by extending the Red Line from the 95th Street terminal station to 130th Street, the Red Line Extension (RLE) Project. CTA and the Federal Transit Administration (FTA) are preparing a Draft Environmental Impact Statement (EIS) that will evaluate the environmental impacts of constructing and operating the extension.

Public Participation Plan

The National Environmental Policy Act (NEPA) requires evaluation of potential environmental impacts associated with federal projects and actions. For this project, the evaluation will be documented in an EIS.

The EIS will focus on the alternatives that emerged from the Alternatives Analysis (AA) and the NEPA scoping process including: a No Action Alternative, a Transportation Systems Management (TSM) Alternative, a Locally Preferred Alternative (LPA): Union Pacific Railroad (UPRR) Heavy Rail Transit (HRT) including a Right-of-Way Option, an East Option, and a West Option, and a Halsted Street HRT Alternative. The EIS will describe the alternatives, the existing environmental setting, the potential impacts from construction and operation of the alternatives, and mitigation measures to reduce or eliminate potential impacts.

The public participation will build on the public and agency input received in the AA, as well as the input received during scoping. The AA process started in 2006 and was completed in 2009 with a recommendation of a range of alternatives to be studied in the EIS. As part of the three-step screening process, CTA hosted six public meetings over three years in order to gather input from the public regarding alternative options.

SECTION 2
GOALS

The public participation plan will guide CTA through a focused public involvement and outreach process for the RLE Draft EIS. The plan is flexible in order to respond appropriately to public and agency issues as they arise. It is anticipated that additional information will become available that will further guide proposed activities. The dates and activities are preliminary and may change. See Appendix A for a preliminary overview of the public participation schedule.

PUBLIC PARTICIPATION GOALS

- Build on previous outreach efforts of the Alternatives Analysis process and scoping
- Make the complex issues associated with the RLE Project and the environmental study process understandable to customers and those using other modes of transportation
- Ensure stakeholders are aware of the planning process and the purpose and content of the proposed project
- Ensure that the project is clearly defined to the public within the umbrella of CTA's other planning projects
- Identify any needs, issues, or concerns of stakeholders
- Provide a range of opportunities for the public and interested stakeholders to comment on the proposed project
- Ensure that the area's diverse population, including tracts adjacent to the project alignment where more than 15% of the population has limited English proficiency as well as Environmental Justice populations (minorities and low income), are included in the process
- Ensure the public understands the project timeline and the financial and right-of-way constraints
- Fulfill the public participation requirements of FTA's New Starts Criteria
- Document all public and agency input
- Provide context for why other projects are currently underway such as Loop Track Renewal, and the Red Line Dan Ryan Track Renewal project

The public participation program provides a variety of communication channels to help the public understand the RLE Project, including its potential negative and beneficial impacts. The program will solicit input and feedback from the public as to their specific needs, issues, concerns, and recommendations.

In order to engage the public to participate in the study process, some basic strategies will include:

STRATEGIES TO ENGAGE THE PUBLIC	APPROACH
■ Make it easy to participate ■ Provide opportunities for constructive dialogue and communication	■ Community meetings within the project area; web access to final project documents; meetings in locations accessible by public transportation and accessible to people with disabilities; outreach materials in English and Spanish and accessible to people with visual impairments
■ Provide timely, easy-to-understand information that helps people provide informed comments	■ Straightforward Citizens Guide to the Environmental Document, newsletters, website, exhibit boards and handouts at meetings
■ Leverage communications resources	■ Work with organizations that have established audiences and channels of communication to more widely disseminate project information
■ Provide multiple ways to obtain information and provide comments	■ Website, mailed notice, e-blasts, community calendars, comment cards, Facebook, Twitter, media, flyers in libraries, CTA System
■ Ensure stakeholders are aware of the planning process	■ Careful review and augmentation of the existing project contact list ■ Stakeholder and Alderman/elected official briefings to identify issues and find additional ways to engage the local community ■ Outreach to community-based organizations representing environmental justice communities
■ Show how public input will be used	■ Document all public and agency input in the Meeting Summaries

SECTION 3
KEY ISSUES

There are four primary issues that have been identified as likely issues of public and stakeholder concern to be explored and discussed during this phase: alignment options, station location options, the benefits of the proposed project to transit disadvantaged communities (communities underserved proportionally by transit investment) and the impacts of construction. A host of other issues also were identified through public input during the Alternative Analysis and EIS scoping phases as listed below. As the study progresses, new key issues may develop, some existing issues will be refined and the appropriate public involvement approach to address key issues will be determined. The list will be amended as the study moves forward.

General Issues/Community Concerns/Opportunities

- Access/benefits for disadvantaged and underserved communities (Altgeld Gardens neighborhood)
- Alignment options and station/stop locations
- Support for the LPA – UPRR HRT Alternative
- Public safety at stations/stops and surrounding communities
- Community compatibility
- Relocation and displacement impacts/enhancement on residential/business/school areas surrounding the project corridor
- Passenger access to local businesses, community, and cultural amenities (improved mobility, neighborhood revitalization)
- Effect/enhancement of quality of life
- Noise and vibration impacts along corridor
- Proximity to Wendell Smith Park and Fernwood Parkway Park

Economic Issues/Concerns/Opportunities

- Jobs/improved economy
- Funding
- Project cost
- Local workforce participation
- Property value impact
- Support for local economic and land use plans and goals

- Transit fare changes

Transportation Issues/Concerns/Opportunities

- Easing congestion in the region
- Coordination/connectivity with other transit systems and modes (Metra, buses, bicycle/pedestrian access, I-Go and Zip Cars)
- Traffic and parking
- Bike and bus access to park and rides
- Improve transit access to and from Far South side
- Reduce congestion at 95th and Dan Ryan terminal

Construction Issues/Concerns/Opportunities

- Length of construction
- Potential traffic/detours/delays
- Potential customer reduction to businesses along corridor during construction
- Potential parking/relocation/displacement during construction
- Noise, impacts to buildings

SECTION 4
KEY AUDIENCES

Anyone who lives, works, plays, learns, and commutes through the RLE project area, or has some involvement or oversight in how the line will operate, is an important audience member. The public participation program creates a structure for learning about the different community interests and characteristics. The project is important to many different groups, each with specific interests in the study. The outreach team will keep these groups involved and continually informed about the process and progress of the analysis. Brief discussions of key audiences follow.

Project Area Residents and Neighborhood Associations

Important issues for neighborhood associations and project area residents include: corridor impacts/enhancements such as neighborhood compatibility, economic development, station locations, and the reduction of impacts on residential areas. The public participation program includes outreach to property owners and residents in the project area. These groups will receive project information through a combination of channels including newspaper display ads, invitation postcards, email notices, transit alert cards, community hall and library flyers, and CTA's Facebook, Twitter, and website. Some of the local communities that may be interested include the following:

- Chatham Avalon Park Community Council
- Chesterfield Community Council
- Residents of Altgeld Neighborhood
- Residents of Beverly Neighborhood
- Residents of Burnham Neighborhood
- Residents of City of Blue Island
- Residents of Cottage Grove Heights Neighborhood
- Residents of Dolton Neighborhood
- Residents of Evergreen Park Neighborhood
- Residents of Fuller Park Neighborhood
- Residents of Gardens Neighborhood
- Residents of Longwood Manor Neighborhood
- Residents of Morgan Park Neighborhood
- Residents of Princeton Park Neighborhood
- Residents of Pullman Neighborhood
- Residents of Riverdale Neighborhood
- Residents of Roseland Neighborhood
- Residents of the City of Calumet
- Residents of Village of Calumet Park
- Residents of Washington Heights Neighborhood
- United Neighborhood Organization

Business/Business Associations/Institutions

Some business stakeholders value the extension's potential to increase customers to local businesses and improve business districts around the corridor line, as well as employees and customers having greater access to the area. This overall category includes the industries, individual businesses, local business leaders, and chambers of commerce. The public involvement effort will solicit ideas and concerns from the business community. These stakeholders will receive invitations to community update meetings and the public hearings and updates on the project as it progresses. A stakeholder briefing may be scheduled to get input. Some of the local business groups that may be interested include the following:

- 87th Street Stony Island Chamber of Commerce
- American Brotherhood of Contractors
- Association of Asian Construction Enterprises
- Black Contractors United (BCU)
- Blue Island Chamber of Commerce
- Bronzeville Chamber of Commerce
- Business and Economic Revitalization Association
- Calumet Area Industrial Commission
- Calumet City Chamber of Commerce
- Canadian National Railway Company
- Chatham Business Association
- Chicago Area Gay & Lesbian Chamber of Commerce
- Chicago Minority Supplier Development Council (CMSDC)
- Chicago Southland Chamber of Commerce
- Chicago Women in the Trades (CWIT)
- Chicagoland Chamber of Commerce
- Cosmopolitan Chamber of Commerce
- Federation of Women Contractors (FWC)
- Greater Auburn -Gresham Development Corporation
- Greater Southwest Development Corporation
- East Side Chamber of Commerce
- Friends of the Parks
- Hegewisch Chamber of Commerce

- Hispanic American Construction Industry Association (HACIA)
- Illinois Hispanic Chamber of Commerce
- Latin American Chamber of Commerce
- Metropolitan Family Services
- Midwest High Speed Rail Association
- National Association of Women Business Owners (NAWBO-Chicago Area Chapter)
- Predestined Incorporated
- Puerto Rican Chamber of Commerce of Illinois
- International Trade Bureau
- Roseland Business Development Council
- Roseland Community Hospital
- South Chicago Chamber of Commerce
- Southeast Chicago Development Corporation
- Southwest REACH Center
- Total Resource Community Development Center
- Union Pacific Railroad
- Women's Business Development Center (WBDC)
- St. Bernard's Hospital and Health Care Center

Associations/Special Interest Groups/Schools

Sensitivity to the surrounding environment is important to the project. The input of various local, state, and federal agencies will be obtained throughout the EIS process. In addition, associations, special interest groups, and schools will be consulted. The director or leader of these groups will be notified of the community update meetings and the public hearings and updated as the project progresses. Some of the key groups that may be interested include the following:

- ACCESS Living
- Alianza Leadership Institute
- Apostolic Church of God
- Carver Military Academy
- Catholic Charities of the Archdiocese of Chicago - Community Affairs & Civic Affairs
- Center for Neighborhood Technology
- Charles H. Wacker Elementary School

- Chicago International Charter School - Prairie
- Chicago State University, Office of Public Affairs
- The Chicago Urban League
- Childrens Center Outreach
- Children’s Developmental Institute
- Christian Fenger Academy High School
- Corliss High School
- Developing Communities Project, Inc.
- Dunne Technology Academy
- Equip for Equality
- Firman Community Services
- Gompers Fine Arts Option School
- Gwendolyn Brooks College Preparatory Academy
- Harlan Community Academy High School
- Historic Pullman Foundation & Historic Pullman Visitor Center
- Higgins Community Academy
- House of Hope
- Illinois Institute of Technology
- John G. Shedd Public School
- Johnnie Coleman Academy
- Kennedy-King College
- Marantha Christian Academy
- Marcus Garvey Math & Science School
- Medgar Evers Fine & Performing Arts School
- Metro Seniors in Action
- Morgan Park High School
- National Association for the Advancement of Colored People (NAACP), Chicago Southside Branch
- Northeastern Illinois University – Jacob H. Carruthers Center for Inner City Studies
- Northwestern University

- Olive-Harvey College
- Park Vernon Learning Academy
- Percy L. Julian High School
- Prayer & Faith Outreach Ministries
- The Pullman Civic Organization
- The Pullman State Historic Site
- Rainbow PUSH Coalition
- Riders for Better Transit (Active Transportation Alliance)
- Riverdale Community Resource Center
- Ronald H. Brown Community Academy
- Roseland Christian School
- Roseland Heights Community Association
- Rosemoor Community Association, Inc.
- Saint Anthony of Padua Parish
- Salem Baptist Church of Chicago
- The Salvation Army
- Senior Service Coalition of Southeast Chicago
- Simeon Career Academy
- Southsiders Organized for Unity and Liberation (SOUL)
- South Central Community Service - Far South
- South Shore Cultural Center
- Southeast Environmental Task Force
- Saint Helena of the Cross School
- The Faith Community of St. Sabina
- Strategies for Community Economic Development & Finance
- Tabernacle Christian Academy
- Teamwork Englewood
- Transportation Equity Network
- United Educational Cultural Academy
- The University of Chicago

- University of Illinois at Chicago - Department of Urban Planning and Policy
- Vivian E. Summers Preparatory School
- West Chesterfield Community Association
- West Chatham Improvement Association
- YWCA Metropolitan Chicago

Commuters

Key issues for commuters include access, passenger capacity and comfort, travel times, station/stop locations, and condition of the facilities. Advanced, timely information is important for this group. Commuters will be notified in the same way that the general public is, through newspaper ads, media stories and social media. In addition, meeting announcements for the public hearings and community update meetings will be posted at the CTA stations and in the CTA trains and buses via car alert cards.

Public Agencies and Local Government

Coordination and cooperation among agencies and all levels of government is an important element of this project. The following key agencies and local government representatives will be notified about the project:

- Chicago Housing Authority
- Chicago Park District
- Chicago Roseland Development Corporation
- Chicago Metropolitan Agency for Planning
- City of Blue Island
- City of Burnham
- City of Calumet
- City of Chicago, Alderman (Ward 9) Anthony Beale
- City of Chicago, Alderman (Ward 10) John Pope
- City of Chicago, Alderman (Ward 21) Howard Brookins Jr.
- City of Chicago, Alderman (Ward 34) Carrie Austin
- City of Chicago, Mayor Rahm Emanuel
- City of Chicago Department of Housing and Economic Development
- City of Chicago Department of Business Affairs and Consumer Protection
- City of Chicago Department of Community Development

- City of Chicago Department of Environment
- City of Chicago Department of Transportation
- City of Chicago Community Development Commission
- City of Chicago Police Department
- Metra Commuter Rail
- Metropolitan Water Reclamation District of Greater Chicago
- Pace
- Cook County Board of Commissioners, Board President Toni Preckwinkle
- Cook County Board of Commissioners, Commissioner (District 4) William M. Beavers
- Cook County Board of Commissioners, Commissioner (District 5) Deborah Sims
- Illinois Commerce Commission
- Illinois Department of Transportation
- Illinois Department of Natural Resources
- Illinois Environmental Protection Agency
- Illinois Historic Preservation Agency
- Illinois General Assembly, State Representative (House-27) Monique Davis
- Illinois General Assembly, State Representative (House-28) Robert Rita
- Illinois General Assembly, State Representative (House-29) David Miller
- Illinois General Assembly, State Representative (House-34) Constance Howard
- Illinois State Senate, Senator (Senate-14) Emil Jones Jr.
- Illinois State Senate, Senator (Senate-15) James Meeks
- Illinois State Senate, Senator (Senate-17) Donne Trotter
- State of Illinois, Governor Pat Quinn
- Mayor’s Office for People with Disabilities
- South Suburban Mayors and Managers Association
- Southeast Chicago Development Commission
- U.S. Department of Energy
- U.S. Department of Health and Human Services
- U.S. Department of Housing and Urban Development
- U.S. Transportation Security Administration

- U.S. Fish and Wildlife Service
- U.S. Environmental Protection Agency
- Federal Emergency Management Agency
- Federal Highway Administration
- Federal Railroad Administration
- U.S. House of Representatives, Congressman (District 1) Bobby Rush
- U.S. House of Representatives, Congressman (District 2) Jesse Jackson
- U.S. Senate, Senator Dick Durbin
- U.S. Senate, Senator Mark Kirk
- Ho-Chunk Nation
- Miami Tribe of Oklahoma
- Peoria Tribe of Indians of Oklahoma
- Sac and Fox Nation of Oklahoma
- Pokagon Band of Potawatomi Indians
- Prairie Band of Potawatomi Nation
- Citizen Potawatomi Nation
- Forest County Potawatomi
- Potawatomi Nation – Hannahville Indian Community
- Sac and Fox Nation of Mississippi in Iowa
- Sac and Fox Nation of Missouri
- Village of Calumet Park
- Village of Dolton
- Village of Evergreen Park
- Village of Riverdale

Media

Media coverage offers an efficient means of communicating with the general public. Effective coordination with local and regional media contacts will be crucial to raising public awareness and explaining the RLE Project. Supplying the media with updated, factual information increases the likelihood of balanced, informative coverage. Ethnic, multi-lingual media coverage will also be an important element of the media outreach.

SECTION 5
LIMITED ENGLISH PROFICIENCY ANALYSIS

A fundamental requirement of the NEPA is communication with local citizens who could be affected by a project. This means that informational materials should effectively communicate with everyone in a project area. The project area has historically supported a very diverse population. It was important at the start of this project, prior to developing notification materials, to determine whether there was a significant population with limited English proficiency within the project area.

During the scoping process, an analysis of languages spoken and English proficiency within the study area was conducted based on data collected from the U.S. Census. The RLE project area crosses 12 census tracts. While the majority of the population in those tracts speaks English, there are several tracts adjacent to the LPA where more than 35% of the citizens speak Spanish/Spanish Creole. Furthermore, some of these tracts have linguistically isolated populations where more than 15% speak Spanish, but speak English less than “Very Well.”

The RLE project can have large impacts on the community, even more so on the properties adjacent to the LPA. Therefore outreach should be conducted to raise awareness of possible impacts among those potentially affected by this project as well as Environmental Justice populations (minorities and low income).

Based on this analysis, outreach materials will be provided in Spanish and a Spanish translator will be available at the public hearings. A meeting may be conducted in Spanish and outreach will be done through other Spanish-speaking outlets.

SECTION 6
ENVIRONMENTAL JUSTICE ANALYSIS

The Draft EIS will assess environmental justice (EJ) issues related to the proposed project alternatives. The EJ analysis will comply with the Federal Executive Order 12898 to address disproportionately high and adverse human health or environmental effects on minority and low-income populations resulting from federal programs, policies and activities. The social groups specifically benefitted or harmed by the proposed action will be identified. Effects of the alternatives upon the elderly, handicapped, non-drivers, transit-dependent, low income, minorities, and Limited English Proficiency (LEP) populations will be described.

The evaluation of minority and LEP impacts will include analysis of census data for the general project area regarding race, color, national origin and ability to speak English well. Census data analysis will be supplemented and verified through field reconnaissance. Potential displacement of residences, businesses and employees will also be considered when evaluating the potential for disproportionate adverse impacts in EJ communities. Changes in minority employment opportunities, the effect of the proposed action on EJ populations and proposed mitigation measures to reduce or avoid disproportionate impacts upon EJ populations will be discussed in the draft EIS.

Large construction projects often disproportionately impact EJ communities because of a lack of opportunity for these communities to become engaged in the planning and environmental process and voice their issues and concerns. *See section 7 for information on how we intend to address this.*

SECTION 7
PUBLIC PARTICIPATION ACTIVITIES

Resolution of Community Concerns

To fully engage EJ communities and try to identify and resolve potential concerns, a series of stakeholder interviews will be conducted with representatives of the various EJ populations. The interviews will be focused on identifying any concerns of EJ communities along the corridor regarding the RLE Project and its associated impacts, as well as the best ways of discussing those concerns with the community and CTA. In addition, the interviews will help further identify specific groups or associations to engage, existing communication vehicles to leverage and best practices to engage specific communities.

Based on the insight gathered through the stakeholder interviews, a series of up to eight focused grassroots meetings will be conducted to work through EJ community concerns and to identify appropriate project modifications and mitigation measures to address concerns. These meetings may be conducted at a neighborhood level, with an existing organization or with a congregation that is potentially impacted by the project.

Depending on the distribution of LEP populations, some of the community meetings may be conducted and facilitated in Spanish. Sign language interpreters and interpreters for other languages will be provided as needed.

Project materials will be prepared in appropriate languages and cultural contexts. If needed to more effectively engage LEP populations, materials specifically tailored to these groups may be developed.

Community Update Meetings

Community update meetings will be held to keep the general community informed about project progress. These meetings will typically be an open house format and may include information on environmental analyses, results of community surveys, changes in project alternatives, identification of potential funding sources, or resolution of neighborhood issues. These meetings will provide opportunities for the public to provide ongoing input that will help CTA with finalizing options for the LPA. The open house format will be confirmed after discussions with CTA and FTA.

Community Update Schedule

Community Update Meetings: Spring 2013

Location: The meeting locations will be within the project area and must meet FTA criteria such as being ADA accessible and near to transit.

Notification materials will include: Newspaper display ads, invitation postcard, email notice, transit alert cards, community hall and library flyers, and CTA's Facebook, Twitter and website.

Stakeholder and Alderman/Elected Official Briefings

Project briefings will provide existing and potential stakeholders an overview of the public participation program and the project. Approximately fifteen stakeholders will be briefed three times at key milestones in the project. Multiple stakeholders may be briefed at a single meeting.

The team will work with CTA and specifically the CTA Government and Community Relations staff to develop the list of key stakeholders that will be briefed. The list might include elected officials, mayors, aldermen, the Mayor's Office for People with Disabilities, city administrative staff, community leaders and neighborhood groups. CTA will identify appropriate milestones to brief stakeholders.

Stakeholder Briefing Schedule

Meetings in Winter/early Spring 2013 to brief stakeholders before the community update meetings scheduled for Spring 2013.

Meetings in early Fall 2013 to brief stakeholders before the public hearings in late Fall 2013.

Public Hearings on the Draft EIS

Two public hearings on the Draft EIS will be held in the same week to inform the public about the project, the contents of the Draft EIS, and to receive comments on the Draft EIS. The same information will be presented at the two public hearings, but the meeting locations will be different. The hearing format will be confirmed after discussions with CTA and FTA.

Public Hearing Schedule

Two Public Hearings: Fall 2013

Location: The hearing location will be within the project area and must meet FTA criteria such as being ADA accessible and near to transit. Locations selected will be distributed throughout the project area to provide full geographic coverage.

Notification materials will include: Legal notice, newspaper display ads, postcard invitation notice, email notice, media release, transit alert cards, community hall and library flyers, and CTA's website.

Media Relations

Regular monitoring of various media coverage and discussions on the project will be conducted. These media may include print media, on-line blogs, and other social media conversations about the project. This information will inform the development of the project.

SECTION 8
PUBLIC PARTICIPATION NOTIFICATION AND INFORMATION MATERIALS

Project Newsletters

Two project newsletters will be developed to deliver the project messages in a clear and concise manner and to provide information and other data about the project. The newsletters will provide an overview of the EIS process and the opportunities for public input. Graphics and maps will be incorporated in the newsletters in order to make the content easy to read and understand. The newsletters will be mailed to all of the people on the project mailing list.

Website

The existing project website will be updated for this phase of the project. The website provides access to project updates, project background, project materials, and documents and announcements. The community update meetings and public hearing meeting dates will be posted in advance on the website. Information on the website will be in a readable format for people with vision impairments.

Citizens Guide to the Draft EIS

The Citizens Guide to the Draft EIS will be prepared to provide an overview of the Draft EIS with pictures from the study area, maps of the alternatives, colorful bold headings, and succinct descriptions of the impacts and proposed mitigation measures for each resource area. The text will explain the process for public review and will get to the heart of technical issues in an easily understood manner. In order to more fully engage the community, artist's renderings or other visual simulations will be used to help residents understand potential effects of what the proposed extension will look like.

Public Notices

Various formats will be used to invite the public to attend one of the public participation meetings. Below is a chart that shows the type of invitation and outreach that will be conducted for each type of meeting. A more detailed description of the notification materials is provided below.

Outreach	Mailed Postcard Invite	Email or Phone Call	Display Ads	Media Release	Other Notification (flyers, e-blast, blogs, transit alert cards, tweets, Facebook posts)
Community Update Meetings	X		X	X	X
Public Hearings	X		X	X	X
Neighborhood Meetings		X			
Stakeholder Briefings		X			

Other Notification (Village Hall, Libraries, Blogs, e-blasts, Transit Alert Cards)

Notifications for the community update meetings and public hearings will be posted and distributed throughout the area including at Village Halls, libraries, e-list serves, and with community groups.

City Hall, Village Hall, or Community Center Announcement Posting Locations

- City of Burnham
- City of Blue Island
- Calumet City
- Village of Calumet Park
- Village of Dolton
- Village of Evergreen Park
- Village of Riverdale

Library Announcement Posting Locations

- Calumet City Public Library
- Chicago Public Library –Altgeld Branch
- Chicago Public Library –Brainerd Branch
- Chicago Public Library –Hegewisch Branch
- Chicago Public Library –Vodak/East Side Branch
- Chicago Public Library –Jeffrey Manor Branch
- Chicago Public Library –Pullman Branch
- Chicago Public Library –South Chicago Branch
- Chicago Public Library -Walker Branch
- Chicago Public Library -West Pullman Branch

- Riverdale Public Library

Blogs/Websites/List servs

- Riders for Better Transit (Active Transportation Alliance) website and blog
- Aldermen list servs and websites
- Car Free Chicago (blog)
- Chi-Town Daily News
- Chicago“L”.org (website)
- CMAP Updates (blogs)
- CTA Twitter
- CTA Facebook
- CTA Tattler (blog)
- Gapers Block (general interest site)
- GridChicago.com (website)
- Movingbeyondcongestion.com (website)
- Metropolitan Planning Council (MPC) (publications: Blog, newsletter, website)
- Ridge99.com
- southwestobserver.com
- Streetsblog (blogs)
- thesixthward.blogspot.com
- Transitchicago.com (website)
- The Urbanophile (an urban affairs blog that covers transportation and economic development)
- Write of Way blog by the Active Transportation Alliance

E-mail Notice

An e-mail notice will be sent to stakeholders, elected officials, and residents who attended previous CTA meetings on this project and provided an email contact, or those who contacted the CTA via email to submit a public comment or request to be added to the email list.

Online Calendars

Information will be sent to online event calendars, most of which are run through newspapers and TV stations. In addition, meeting notices will be sent to local chambers of commerce and to large organizations that cover a wide audience and would communicate with members in the areas served by the lines, such as the Chicagoland Chamber of Commerce, Illinois Chamber of Commerce, and the Association Forum of Chicagoland.

Promotion in Transit: Transit Alert Cards

Meeting announcements for the public hearings and community update meetings will be posted at the CTA stations and in the CTA trains and buses via car alert cards.

Social Media

There are many opportunities for CTA to reach out and to listen via social media. Information will be posted on the CTA Facebook group page and Twitter sites. CTA also will monitor the ongoing social media dialogue about CTA and the project in order to identify concerns, answer questions, respond to ideas, and correct any misunderstandings or misinformation. CTA also will tap social media sites of partner organizations to provide information and hear feedback.

Display Advertisement for Community Update Meetings and Public Hearings

Display advertisements in local and regional newspapers will be used to publicize the community update meetings and the public hearings. The community update meeting display ads will provide the time, date and location of the update meetings. A more formal public hearing display ad will be placed that includes information on the project, the alternatives analysis, the meeting information, and where and when to submit comments. An email and postal mail address will be provided for written comments. The newspapers in which display ads may be placed include the following:

Publication Placement

- Beverly Review
- Chicago Crusader
- Chicago Defender
- Chicago Sun-Times
- Chicago Tribune
- Hoy
- LaRaza
- Red Eye
- Southtown Star

Media Release

Media releases will be issued to ensure that media outlets are aware of the public meetings and have adequate background information with which to write about the EIS process.

Meeting Materials

Information boards will be developed for the public hearings and the community update meetings and general hand-outs will be prepared.

Project Database

A comprehensive database of approximately 5,000 stakeholders for the RLE Project has been established and maintained. The database includes elected officials, special interest group representatives, agency staff persons who attended the scoping meetings, and persons who requested to be on the mailing list. The mailing list includes property owners and tenants adjacent to the centerline of the proposed project.

SECTION 9
DOCUMENTATION

Comment Tracking/Documentation/Response Management

The public meetings will be fully documented for the administrative record. Comments will be received by mail, email, and by comment card at the public hearings and community update meetings. A summary of all public meetings will be included in the Draft EIS. The summary will include comment cards, letters, attendance sheets, notification materials, and a summary of verbal and written input, such that an evidential record of the meetings is documented.

CHICAGO TRANSIT AUTHORITY (CTA)

APPENDIX A

DRAFT ENVIRONMENTAL IMPACT STATEMENT

Public Participation Plan Overview Schedule 2012/2013

Activity	2012: Summer	2012: Fall	2013: Winter	2013: Spring	2013: Summer	2013: Fall/Winter
Project Milestones						Fall: Publish Draft EIS and Notice of Availability (NOA) in Federal Register Fall-Winter: Public Comment Period (30 days)
Public Participation Activities						
CTA Board Meetings	Brief CTA Board		Brief CTA Board			Brief CTA Board
Public Meetings (neighborhood, community update, and public hearings)		As needed: Neighborhood Meetings to Resolve Concerns	As needed: Neighborhood Meetings to Resolve Concerns	Spring: Update Meetings		Fall: Public Hearings (2) on Draft EIS
Stakeholder and Alderman /Elected Official Briefings			Winter: Stakeholder Briefing Meetings	Early Spring: Stakeholder Briefing Meetings		Fall: Stakeholder Briefing Meetings
Public Participation Notification and Information Materials						
Mailing List/Database	Update	Update	Update	Update	Update	Update
Public Notices				Spring: Postcard Notice for Update Meetings		Fall: Public Hearing Notice
Website	Update	Update	Update	Update	Update	Update
Display Ad/Legal Notice			Display Ads for Update Meetings			Fall: Public Hearings Display Ad/Legal Notice
Media Outreach (Releases distributed by CTA)			Winter: Update Meeting Advisory Release			Fall: Public Hearing Advisory Release & Post Meeting Release
Other Notification: Libraries, Village Halls, e-blasts, blogs, community calendars, transit alert cards			Notification Package for Update Meetings			Notification Package for Public Hearings
Citizens Guide to the Draft EIS					Develop Guide	Print & Distribute Guide
Meeting Materials (boards, handouts, sign-in, etc.)			Meeting Materials for Update Meetings			Meeting Materials for Public Hearings
Project Newsletters		Develop/Distribute Newsletter			Develop/Distribute Newsletter	
Meeting Summary Reports				Update Meeting and Neighborhood Meeting Summaries		Public Hearing Report

Note: All dates are preliminary and subject to change.

APPENDIX B: Stakeholder Interview Summary

Development of the public participation plan was informed by interviews with representatives of community members to identify the most effective outreach and engagement strategies, activities, languages, and channels. Interviews were conducted in April 2012.

Categories of stakeholder perspectives included:

Elected Officials/Aldermen

Community Organizations

Older Adults and People with Disabilities

Businesses

Non-Profits (including places of worship) Serving Environmental Justice Populations

Input Influenced the Public Participation Plan

There is a high level of interest in the Red Line Extension (RLE) Project among the categories of stakeholders listed above. As a result of the process to identify stakeholders to interview, the list of stakeholder organizations in the plan was expanded.

Using a variety of both online and offline communication channels and tools, CTA is most likely to reach the greatest number of interested members of the community. Tapping established communication channels which come from trusted sources means CTA is more likely to be heard. Many of the interviewees offered up specific communications channels which may be used directly or through the stakeholders. These communication channels, such as listservs, websites, and publications, have been added to the plan. Visuals were highlighted as being an essential part of the project information produced and shared.

Communicating with and through places of worship is critically important in the communities along this project corridor.

Stakeholders suggested that the community preferred a more interactive meeting format than CTA has conducted in the past. Using a combination of small community resolution meetings, larger public open house meetings, and targeted meetings with community groups, outreach resources will be leveraged so that more of the community is reached by their trusted sources of information. Working with such groups to gather input from the community also will enhance effectiveness in working with Environmental Justice communities.

Availability of Spanish-language materials and Spanish speakers at meetings will be critical to engaging the isolated Spanish-speaking, limited English proficiency populations along the corridor.

Stakeholders advised that at future meetings CTA have new information to share and be at a point in the process where public input could influence decisions to be made in the near term. This information influences the plans for preparing for the public meetings.

SAFETEA-LU - Safe, Accountable, Flexible, Efficient Transportation Equity Act: A Legacy for Users

Section 1
Purpose of This Coordination Plan

The Federal Transit Administration (FTA) and the Chicago Transit Authority (CTA) have initiated preparation of a Draft Environmental Impact Statement (EIS) for the Chicago Red Line Extension (RLE) Project. FTA is serving as the lead agency for purposes of National Environmental Policy Act (NEPA) environmental review. The project participants for this Coordination Plan consist of FTA, CTA, and federal, state, and local participating agencies pursuant to the Safe, Accountable, Flexible, Efficient Transportation Equity Act: A Legacy for Users (SAFETEA-LU) of 2005, Section 6002.

This Coordination Plan provides a structure for coordinating public and agency participation and comments on the Draft EIS. The plan is intended to guide the CTA and the public through the process. More specifically, the plan outlines the public and agency activities that will take place. The environmental planning and review process for the RLE project began with an Alternatives Analysis (AA) process and will conclude with a NEPA determination and Record of Decision (ROD) from the FTA. Following the issuance of the ROD, the permitting process will begin. CTA will follow this Coordination Plan to solicit public and agency input on the project and to ensure that the received input is considered in the decision-making process. Both agency coordination and the Public Participation Plan (PPP) are addressed below.

The Coordination Plan is considered a "living document" and is designed to provide flexibility, as needed, to address changes in the project and therefore may be adjusted from time to time in response to the evolving communication needs of the project.

This plan complies with SAFETEA-LU, Section 6002, and serves as a plan for coordination (Section 139(g)(1)).

Section 2
Project Summary

The CTA is proposing to extend the Red Line from the 95th Street station to the vicinity of 130th Street, subject to the availability of funding. The proposed extension would include four new stations. Each new station would include bus and parking facilities. This project is one part of the Red Ahead Program to extend and enhance the entire Red Line.

The project area is 11 miles south of the "Loop," Chicago's central business district and encompasses approximately 20 square miles. Figure 2-1 shows the project area.

Section 3
Project Process

In accordance with federal regulations, CTA, in coordination with FTA, will complete the following steps to complete the NEPA environmental document for the project:

- Publish the Notice of Intent (NOI) in the Federal Register
- Complete project scoping to ascertain the scope of the Draft EIS, project purpose and need, and range of alternatives considered, and identify potential impacts and potential mitigation measures to be addressed in the environmental document
- Prepare a Draft EIS
- Complete a public review and comment period for the Draft EIS
- Obtain approval from FTA to enter into Preliminary Engineering
- Prepare a Final EIS
- Obtain Chicago Transit Board certification of the Final EIS and approval of the project
- Obtain a ROD from FTA

The NOI was published in the Federal Register on September 1, 2009. One agency scoping meeting was held on September 24, 2009 and two public scoping meetings were held on September 22, 2009 and September 24, 2009. A public open house was held on August 2, 2011. The Draft EIS analysis will be conducted in 2012 and 2013. The schedule for the remaining steps is dependent on identification of funding.

Agency and public coordination will proceed on an as-needed basis until the release of the Draft EIS. Upon the release of the Draft EIS a public and agency comment period will begin.

Section 4
Agency Participation

As the project lead agencies, FTA and CTA are responsible for preparing the EIS. In accordance with SAFETEA-LU, Section 6002, CTA is required to identify and involve federal, state, regional, and local agencies in the development of the project. Agency coordination will occur on an on-going basis throughout the project development process, with opportunities for public and agency participation occurring at several different stages of the EIS process, including the following major coordination points:

- Developing the scope of the Draft EIS, including issues to be addressed, methodologies to be used to evaluate potential effects, and the significance criteria
- Reviewing and commenting on the Draft EIS throughout the public review period, which includes public meetings that will be held to receive comments
- Commenting on the alternatives including input received at the agency scoping meeting on September 24, 2009
- Notification of the completion of the Final EIS
- Completion of permits, licenses, and approvals following the ROD

4.1 Identification of Cooperating and Participating Agencies

4.1.1 Cooperating Agencies

Cooperating agencies are, by definition in 40 CFR 1508.5, federal agencies with jurisdiction, by law or special expertise, with respect to any environmental impact involved in the proposed project. A state or local agency of similar qualifications may, by agreement with the lead agencies, also become a cooperating agency. The cooperating agencies are by definition participating agencies as well, and while the roles and responsibilities of both are similar, the cooperating agencies have a slightly greater degree of authority, responsibility, and involvement in the environmental review process.

The Federal Highway Administration (FHWA) has requested to be a cooperating agency in the RLE project because a portion of the proposed route extends along I-94 and I-57 and would cross over I-57 as it turns south along either the Union Pacific Railroad right-of-way or Halsted Street. FTA and CTA will consider additional cooperating agencies if approached per 40 CFR 1501.6.

4.1.2 Participating Agencies

Participating agencies can be federal, state, tribal, regional, and local government agencies that may have an interest in the project. The responsibilities of these agencies are defined in SAFETEA-LU, Section 6002, and include but are not limited to:

- Participating in the FTA process starting at the earliest possible time, especially with regards to the development of the purpose and need statement, range of alternatives, methodologies, and the level of detail for the analysis of alternatives
- Identifying, as early as practicable, any issues of concern regarding potential environmental or socioeconomic impacts of the project
- Participating in the issue resolution process, described in Section 4.4
- Providing meaningful and timely input on unresolved issues
- Participating in the scoping process

Accepting the designation as a participating agency does not indicate project support and does not provide the agency with increased oversight or approval authority beyond its statutory limits, if applicable.

Participating agencies for the project are listed in Appendix A. They include federal agencies that did not affirmatively decline the invitation to become a participating agency and regional, state, and local agencies that affirmatively accepted the invitation to become a participating agency.

In accordance with SAFETEA-LU Section 6002 requirements, FTA, in coordination with the CTA, prepared and mailed participating agency invitation letters to 80 agencies with a potential interest in the project on September 1, 2009.

Letters were sent to update participating agencies in June 2011 on the project progress and invite them to the public open house meeting held on August 2, 2011.

4.2 Agency Coordination Objectives

The primary objectives of the CTA, related to the involvement of these and other agencies throughout the project development process, are to:

- Ensure the open and timely exchange of information, ideas, and concerns between the participating agencies, FTA, and CTA throughout the project development process
- Ensure the appropriate integration of the project into the communities through which it operates
- Avoid substantial design changes during the future permitting process by identifying and addressing the permitting requirements of individual agencies during conceptual and preliminary engineering, as practicable

4.3 Agency Coordination Structure

4.3.1 Early Coordination

Agency participation and coordination began in 2006 during the first phase of the project, the AA phase. Agency participation and coordination for the EIS began with the issuance of the NOI in September 2009 and the start of scoping activities. Early coordination creates an opportunity for participating agencies to provide input and guidance on the scope of the environmental document, methods used in the environmental analysis, purpose and need, and the alternatives to be analyzed in the Draft EIS.

EIS coordination was initiated as part of the scoping process by publishing the NOI in the Federal Register on September 1, 2009. In addition, CTA mailed the NOI and scoping information to 28 local, 15 regional, 19 state, and 12 federal agencies, and six Native American tribes, to ensure the awareness of the project and invite scoping comments.

An agency scoping meeting was held on September 24, 2009 to provide additional opportunities for agencies to identify their interest in coordination and provide input on the purpose and need, range of alternatives, proposed schedule, potential areas of impact, and the methodologies to be used to evaluate effects.

After considering input received during the scoping process, the lead agencies will further articulate the project's purpose and need. In accordance with existing guidance, issued by Congress in its conference report on SAFETEA-LU, other federal agencies should afford substantial deference to the FTA's articulation of the purpose and need for a transportation action.

4.3.2 Coordination during Project Development

Ongoing and active coordination will be undertaken with all agencies identified during the AA and scoping processes as having jurisdiction over the right-of-way of the proposed project or an interest or expertise in a specific environmental resource, including cooperating and participating agencies. This coordination process will consist of meetings with individual agencies and appropriate CTA and consultant staff, to discuss the specific concerns and suggestions. Subsequent meetings with agencies will be scheduled as needed to ensure that the appropriate level of coordination and communication is attained, especially as the project progresses. The purpose of these meetings will be to identify and resolve substantive issues, as early as practicable, in the design and environmental review process; finalize the methods that will be used in the environmental analysis; and collect data related to the project. In addition, this direct coordination process will support the documentation of official communications and any agreements between CTA and these agencies.

An effort will be also made to hold meetings with other agencies that may indicate specific issues of concern as the project progresses, and CTA will coordinate with all agencies to ensure that issues are addressed early in the process.

4.3.3 Coordination of Review and Comment on the Draft EIS

As a cooperating agency, FHWA will review administrative drafts of the Draft EIS along with FTA and CTA. Participating agencies will receive a Notice of Availability of the Draft EIS. They will be invited to attend the public hearings on the Draft EIS and to review and comment on the Draft EIS during the public comment period.

4.3.4 Coordination Subsequent to Draft EIS and Prior to the Record of Decision

Coordination of the Final EIS and ROD will be similar to coordination of review and comment on the Draft EIS. The participating agencies will receive a Notice of Availability of the Final EIS and project approval actions. All participating agencies will receive notification of the issuance of the ROD.

4.3.5 Coordination Subsequent to the Record of Decision

After approval of the ROD, the CTA will consult with the FTA prior to requesting any major approvals or grants to establish whether or not the approved EIS remains valid. These consultations will be documented as needed. Per 23 CFR 771.129, an EIS may become invalid if the NEPA process does not proceed as described below:

- A written evaluation of the Draft EIS must be prepared if an acceptable Final EIS is not submitted within three years from the date that the Draft EIS is circulated. The purpose of this evaluation is to determine if a supplement to the Draft EIS or a new Draft EIS is needed.

- A written evaluation of the Final EIS must be prepared before further approvals may be granted if major steps to advance the action have not occurred within three years after the approval of the Final EIS. Major steps to advance the action may include undertaking final design, acquiring significant portions or right-of-way and/or approving plans.

Agencies with permitting authority will continue to be consulted throughout the re-evaluation process as needed and the permit application development process. Permit applications will be submitted and data developed to support needs identified by the permitting agencies.

4.4 Issue Resolution Process

The lead agencies, cooperating agencies, and participating agencies will work cooperatively to identify and resolve issues that could substantially delay completion of the environmental review, and issues of concern that could substantially delay or prevent issuance of permits or approvals needed for the project.

The following issue resolution process will be followed:

- Every attempt will be made to resolve issues of concern between the lead agencies and participating agencies as they arise through direct agency meetings. These meetings will be held as needed during the NEPA process to discuss and resolve the issues of concern. The meetings will be specific to the issue and agency involved. Therefore, as appropriate, the meetings could range from a single meeting involving technical staff of the agency and CTA to a series of meetings involving incrementally higher executive-level participation from the participating agency and CTA. An effort will be made to hold up to three such meetings within a reasonably available time period consistent with the project process and schedule, to resolve an issue of concern in a timely manner before proceeding to the next step of the process, described below.

- If direct meetings between the agencies are not sufficient to resolve an issue of concern in a timely manner:
  - An official issue resolution meeting will be scheduled.
  - If resolution cannot be reached within 30 days following such a meeting, and a determination has been made by FTA that all information necessary to resolve the issue has been obtained, then:
  - FTA will notify the heads of all participating agencies, CTA, the Committee on Environment and Public Works of the Senate, the Committee on Transportation and Infrastructure of the House of Representatives, and the Council of Environmental Quality of the FTA determination
  - FTA will publish such notice in the Federal Register

Section 5
Summary of Public Participation Plan

The Draft EIS phase of the RLE project will involve an extensive and inclusive community outreach process that builds upon and enhances the public engagement efforts developed during the AA phase; the RLE PPP is included as Appendix B. RLE public involvement includes outreach not only to neighborhood stakeholders, but also to current and potential CTA riders, and the wider population of transit users in Cook County. This effort will also re-engage targeted stakeholders identified during the AA while identifying and involving potentially new stakeholders who may now, more than before, have a special interest in this project. The PPP builds upon CTA's experience with the AA, including lessons learned and identification of potential opportunity areas as well as CTA's best practices in public outreach.

5.1 Compliance with Federal Requirements

SAFETEA-LU has a strong federal emphasis on public participation, requiring that the PPPs of CTA's planning processes "be developed in consultation with all interested parties and … provide that all interested parties have reasonable opportunities to comment on the contents of the transportation plan." SAFETEA-LU's broad definition of participation by "interested parties" includes as its partners, groups, and individuals who are affected by or involved with transportation in the area surrounding the project's service area. Examples stated include citizens, affected public agencies, representatives of public transportation employees, private providers of transportation, representatives of users of public transportation, representatives of users of pedestrian walkways and bicycle transportation facilities, representatives of the disabled, and other interested parties. These interested parties are to be provided with a reasonable opportunity to comment on the transportation plan.

As outlined in the Act, methods to accommodate these goals to the maximum extent possible include:

- Holding any public meetings at convenient and accessible locations and times
- Employing visualization techniques to describe plans
- Making public information available in hard copy and electronically accessible formats and means, such as the internet, as appropriate, to afford reasonable opportunity for consideration of public information
- Coordinating local public participation/involvement processes with statewide public involvement processes wherever possible to enhance public consideration of the issues, plans, and programs, and reduce redundancies and costs

SAFETEA-LU also requires that public meetings be held at convenient and accessible times and locations, that all plans be available by website, and documents be written in easy, understandable language utilizing visual components.

This PPP was developed to be compliant with SAFETEA-LU, the public participation requirements of NEPA, and the FTA New Starts program.

5.2 Goals and Objectives of the Public Participation Process

The PPP for the RLE project provides an efficient, proactive, and comprehensive guide to community outreach efforts throughout each phase of this project. This plan builds on the foundation of the public engagement effort developed during the AA. The public involvement and consensus-building effort for this project has several goals and objectives, including:

- Utilize an inclusive outreach strategy that maximizes input from a broad range of project stakeholders
- Provide forums for residents, businesses, and community leaders to participate in the planning
- Create multiple opportunities for the generation of ideas, comments, and possible mitigation measures
- Establish a forum for educating stakeholders on a regular basis as the project evolves

The intent of the public involvement process is to work cooperatively with the community toward the development of a preferred alternative that meets the purpose and need of the project. Issues to be addressed during the Draft EIS outreach process for the RLE might include further development and refinement of the alternatives, locations of stations, bus/rail interface and other transit issues, urban design, land use, neighborhood and community impacts, environmental impacts, and potential mitigation measures.

5.3 Description of Public Participation/Involvement Activities

5.3.1 Schedule Overview

The schedule for the public participation process is summarized in Table 5-1. The proposed schedule for preparation of the Draft EIS will be shared with the public and participating agencies. A series of community update meetings and formal public hearings will be held at key milestones including the dissemination of the Draft EIS. In addition, CTA will continue to meet with individual stakeholder groups. The public engagement effort will continue as the NEPA process progresses.

Table 5-1: Public Participation Process Schedule

Schedule	Activity
August 12, 2009	Chicago Transit Board Meeting
September 1, 2009	Publish NOI in Federal Register Public Comment Period Begins
September 1, 2009	Mail Participating Agency Letters
September 2009	Distribute Media Outreach Releases
September - October 2009	Stakeholder Briefing Meetings
September 24, 2009	Agency Scoping Meeting
September 22 and 24, 2009	Public Scoping Meetings
October 27, 2009	Public Comment Period Ends
August 2, 2011	Public Open House Meeting
Spring 2013	Stakeholder Briefings
Spring 2013	Community Open House Meeting
Fall 2013	Stakeholder Briefings
Fall 2013	Public Hearings
Fall 2013	Public Comment Period

5.3.2 Stakeholder Identification and Community Profile

CTA will maintain and update the stakeholder database developed during the AA and scoping phases to track interested individuals and groups, areas of interest, communication, and other pertinent information for the duration of the project. Building on the database developed during the AA phase, CTA will continue to provide ongoing maintenance and updates to keep the database current.

The Draft EIS phase will include extended outreach beyond the project area, including all jurisdictions that could potentially benefit or be adversely affected by the RLE project. New project stakeholders may be identified as the project progresses in addition to those identified during the AA and scoping phases of the project. All stakeholders will be engaged throughout the NEPA process. Stakeholders for the RLE project include, but are not limited to:

- Local, county, federal, and state elected officials
- Neighborhood councils, associations, and community councils
- Business and labor associations
- Retail and entertainment center destinations
- Education, cultural, religious, and health care institutions along the proposed alignments

- Transit advocacy and environmental groups
- Public agencies/officials

Communication with individuals and organizations beyond the physical project area will be a priority during this phase.

Further, building on information gathered during the AA phase, CTA has developed a stakeholder outreach strategy that includes an identification of:

- Key communities and constituencies in the project area
- Key communities and constituencies outside the project area, likely to benefit from the project
- Issues of special interest to communities and constituencies
- Strategies and actions to address these communities, constituencies, and issues

In this way CTA will be able to monitor the issues and priorities of the distinct communities within and of relevance to the project in and beyond the project area.

5.3.3 Public and Agency Scoping Meetings and Elected Official Briefings

CTA conducted two public scoping meetings, one agency scoping meeting, and briefed three elected officials and one community business association within the scoping period of the project to solicit comment and input for the Draft EIS prior to the Oct 27, 2009, deadline for public scoping comments.

5.3.3.1 Public Scoping Meetings

Two public scoping meetings were held in the project area on September 22 and 24, 2009.

Scoping meetings are a useful opportunity to obtain information from the public and governmental agencies. In particular, the scoping process asks agencies and interested parties to provide input on the proposed alternatives, the purpose and need for the project, the proposed topics of evaluation, and potential impacts and mitigation measures to be considered. These meetings were documented in a Scoping Report.

5.3.3.2 Agency Scoping Meetings

An agency scoping meeting was held at CTA's offices on September 24, 2009. This meeting was held to coordinate and facilitate work with the designated federal, state, and local agencies. Agendas and sign in sheets for all meetings were prepared and discussions and agreements were fully documented. A detailed summary of comments and meeting notes were prepared afterwards.

5.3.3.3 Stakeholder and Alderman/Elected Official Briefings

An initial task in the public involvement program was to identify areas of agreement and conflict among various stakeholders. Individual meetings with key stakeholders were informal but structured to obtain input on goals, objectives, key issues, preferred communication tools, and public policy considerations. Input obtained from the stakeholder briefings was incorporated in the public participation program. Three elected officials and one stakeholder with interest in the project area were identified and briefed..

5.3.4 Events

To reach out to those not active in civic issues or who do not typically attend community meetings, CTA will explore the feasibility and effectiveness of other non-traditional outreach opportunities including participation in local events, festivals, fairs, and other grassroots outreach opportunities such as farmers markets, mall or shopping center booths, and other more community-focused events. This outreach technique was not employed during the AA or scoping, but remains a potential tool for use during the preparation of the Draft EIS.

Upcoming events including public open house meetings, public hearings, and stakeholder outreach, are summarized in Table 5-1

5.3.4.1 Summer 2011 Public Open House Meeting

A public open house meeting was held on August 2, 2011 to update residents and participating agencies about the project progress. This update summarized the results of the NEPA scoping process that concluded in October 2009. The open house was an opportunity for community members to ask questions about the range of actions, alternatives, environmental effects, and mitigation measures to be analyzed in the Draft EIS. A detailed summary of the meeting with documentation on comment received was prepared.

5.3.4.2 Stakeholder and Alderman/Elected Official Briefings

CTA representatives conducted 12 briefings with elected officials and stakeholders about the project in July and August 2011. Briefings generally covered a description of the project and the scoping process. Meeting notes were prepared.

5.3.5 Public Notice and Review

Public notices for scoping meetings included:

- NOI
- Participating agency invitation letters
- Public scoping invitation notices which were mailed out two weeks prior to the scoping meeting and were translated into Spanish
- Meeting notices were posted at local village halls and libraries

- Email notifications were sent to all in the project database

5.3.6 Written Materials

CTA will develop text and visuals for collateral materials, specifically newsletters, meeting materials, frequently asked questions, technical handouts on specific topics, and other materials as needed throughout the project. Materials for the RLE project will be translated into Spanish and will be available in other languages, including Braille, upon request. See Appendix B - Public Participation Plan.

5.3.7 Website

A project website was developed for the environmental phase. The website provides access to project updates, project background, project materials, documents, and announcements. Public meeting dates were posted in advance on the website. In addition to serving as a source for public information, the website will also serve as a way to gather information. The website includes a clickable link to the project email address that allows people to reach CTA project managers with their comments. The webpage will facilitate ongoing database additions and provide a means for the community to provide input, ask questions, receive responses, and distribute project materials. The website will be updated as the project progresses.

5.3.8 Media

CTA takes a proactive role working with the mainstream media to publicize all community meetings and to raise awareness of RLE project. This includes the development of press releases, complemented by outreach to grassroots, ethnic and niche print, broadcast and public access (radio and television), and new media, as applicable. See Appendix B – Public Participation Plan for details.

5.3.9 Accommodations

All public meetings will be scheduled at locations accessible by transit users and wheelchair accessible. Information regarding bicycle lockers/storage can also be researched upon request. Interpreters (language and hearing) or other auxiliary aids will be arranged if requested at least five days prior to a meeting.

5.4 Outreach to Traditionally Underserved Groups

Federal requirements for PPPs include a process for seeking out and considering the needs of those traditionally underserved by existing transportation systems, such as low income and/or minority groups. CTA has actively worked with organized business and community groups in the project area and will continue outreach efforts to transit users and traditionally underserved groups. In addition, materials will be translated into Spanish. See Appendix B – Public Participation Plan for details.

5.5 Public Participation Measures of Effectiveness

On a periodic basis, the public participation process will be reviewed to determine if modification of any particular strategy is necessary or if additional strategies need to be incorporated into the PPP to reach desired demographic groups.

In addition, the PPP will be revised as needed throughout the NEPA process to ensure that the outreach and involvement efforts are appropriate for the project area and that issues continue to be identified and addressed.

Appendix A
Participating Agencies

Eighty local, regional, state, federal, and tribal agencies were invited to be participating agencies (listed in Table A-1). Of those, 17 agencies affirmatively accepted the invitation and an additional 14 federal and tribal agencies did not decline. Federal and tribal agencies that do not decline the invitation are added to the list of participating agencies. In addition, the FHWA requested to become a cooperating agency. Participating agencies are listed in Table A-2.

Coordination with Chicago Park District

MEETING NOTES

RE: **CTA-CWC-Chicago Park District Meeting**
Red Line South Extension Project

MEETING DATE: **April 18, 2011**

CHAIRPERSON: **Sonali Tandon, CTA**

LOCATION: **at CTA and via Conference Call**

TO: **Distribution and All Attendees**

ATTENDEES:

Name	*Initials*	*Organization / Title*
Sonali Tandon	ST	CTA
Steve Hands	SH	CTA
Joe Iacobucci	JI	CTA
Helene Kornblatt	HK	CWC Transit Group
Claudia Lea	CL	CWC Transit Group
Joseph Bornstein	JB	Chicago Park District

PREPARED BY: Claudia Lea

ISSUE DATE: April 19, 2011

Meeting called to order at 1:30 pm

Project Background

Sonali Tandon discussed the project background, including the Alternatives Analysis process, the determination of a Locally Preferred Alternative (Union Pacific Railroad Heavy Rail Transit Alternative – UPRR HRT Alternative), the scoping process, as well as an overview of the EIS process.

Helene Kornblatt provided background regarding the 4(f) process: Section 4(f) of the Department of Transportation Act of 1966 prohibits the Federal Transit Administration (FTA) from approving a project or program that uses land from a significant public park, recreation area, wildlife or waterfowl refuge, or historic site except if the Administration determines that the other alternatives are not feasible. All parkland that is used for a transit project needs to be compensated. A 4(f) report will need to be completed as part of the EIS.

West Option

The UPRR HRT West Option would intersect Fernwood Park, located along the proposed alignment between 99th Street and 103rd Street. Fernwood Park is a linear park which runs between the UPRR tracks and Eggleston Avenue. There are limited improvements to the park (no sidewalks), and it is not programmed much as a park. Abandoned houses and vacant lots are located along the park.

Joseph Bornstein indicated that CPD would be amenable to talking about this park. JB stated that if any of the park is used for the Red Line Extension, the remainder of the park will be unusable, and CTA will be responsible for a one-to-one acreage trade for the entire park area between 99th and 103rd Street. JB indicated that there would likely be land available to create new parks given the vacant land in the near vicinity of the park, but CTA will need to see what the community would like. CPD has no current plans for improvements to Fernwood Park. CTA will recommend several sites in the vicinity of Fernwood Park that would replace the entire Fernwood Park area (4.5 acres), and will begin by reviewing City of Chicago owned property.

East Option

The UPRR HRT East Option would intersect Wendell Smith Park, located on South Princeton Avenue between 99th Street and 99th Place. Wendell Smith Park is 4 acres in size and has basketball courts, baseball fields, a play lot, a recreation building, and 0.33 miles of walking trails. There are regularly-scheduled basketball, baseball, and softball games, concerts, and day camps that take place at the park. The UPRR HRT East Option would run through the northwest corner of the park. Impacts to the park would involve the loss of trees in the unused and unkempt northwest corner of the park, a total of 0.66 acres of impacted area.

The East Option would also run through the eastern parcel of Block Park. Block Park is located on two parcels, to the east and west of South Harvard Avenue, and runs along the eastern boundary of the UPRR. A natatorium was located on this property until 1998. A radio tower is located on the property at this time. Approximately 0.69 acres of the park would be impacted by the UPRR HRT East Option; the total parcel area is 1.26 acres. Following the meeting, JB provided information that the potentially impacted parcel is leased property from the Water Department. He indicated that the lease on the property is most likely expired, and CTA may need to work with the Water Department regarding the future of their parcels.

Process

- CTA will need to get feedback from the community regarding their wants and needs
- CPD does one-for-one land swaps
- CPD requires a two-acre minimum for new parks. CPD would prefer new parks to be greater than two acres, if possible.
- Land actions need to go though the CPD Board, which is a relatively quick process.
- CTA will need to discuss findings with FTA prior to proceeding.
- Funding for the park development will need to be discussed with FTA.
- CPD estimates that it costs ~$1 million per acre for development of property into usable park land, which includes lighting, improvements, etc.

Next Steps

As CTA begins to draft the EIS, they will get back in touch with CPD regarding potential sites and compensation, based on FTA's feedback. At this time, the EIS is not funded. CPD has no plans for further park development in the vicinity of the LPA.

Please notify the author of the minutes of any corrections and/or clarifications within five (5) business days.

cc: Attendees

MEETING NOTES

RE: **Chicago Park District Meeting**
Red Line Extension Draft EIS

MEETING DATE: **Wednesday, July 24, 2013 1:00PM**

LOCATION: **Chicago Park District Offices**

ATTENDEES:

Name	***Initials***	***Organization***
Sonali Tandon	ST	CTA
Rob Rejman	RR	Chicago Park District
Doreen O'Donnell	DO	Chicago Park District
Helene Kornblatt	HK	CWC Transit Group
Kansai Uchida	KU	CWC Transit Group

PREPARED BY: Kansai Uchida

ISSUE DATE: Thursday, July 25, 2013

- CTA is currently preparing the Draft Environmental Impact Statement for the Red Line Extension project. The ultimate funding sources and schedule for project implementation are still being determined.
- CPD's policy regarding other agencies' use of their property is replacement (whether the property is active or not). Replacement does not need to be in the same location.
- CTA, CPD, and CWC reviewed draft conceptual plan and profile drawings for the UPRR Rail Alternative options at Wendell Smith Park, Fernwood Parkway, and Block Park.
- CPD recently renewed its lease on Block Park for 25 years.
- CPD recognized that a Fernwood Parkway alignment might mean fewer residential displacements. If CPD received equal acreage nearby, they would have the opportunity to provide a better park for the neighborhood than the existing Fernwood Parkway.
- CWC described the potential Section 4(f) findings:
    - Use of Wendell Smith Park under all of the UPRR Rail Alternative Options
    - Use of Fernwood Parkway under the UPRR Rail Alternative West Option
    - De minimis impact on Block Park under the UPRR Rail Alternative East Option
- CPD understands the accessibility benefits that the extension would provide to the community. CPD sees this as an opportunity to improve existing parks or create a new park in alternate locations that would better serve the neighborhood.
- CPD will conduct an internal analysis of the needs of the community, and potential parks for improvement or new park lands to compensate for parks that may be affected by RLE project alternatives.

- CPD would like to have a representative attend a future meeting that CTA may have with Friends of the Parks.
- ST provided a copy of map showing Red Line Extension alternatives.

Please notify the author of the minutes of any corrections and/or clarifications within five (5) business days.

cc: Attendees

Meeting Notes

Date: Thursday, May 8, 2014

Meeting: CTA with Chicago Park District and Friends of the Parks

Meeting Purpose: CTA to share RLE Project updates and Parks Impacts

Present:
Erika Sellke, Chicago Park District
Cassandra Francis, Friends of the Parks
Sylvia Jones, Friends of the Parks
Sonali Tandon, Chicago Transit Authority
Virginia Jackson, CWC Transit Group
Jenifer Palmer, CWC Transit Group

Time: 1:00 pm to 2:00 pm

Location: CTA Headquarters, 567 West Lake Street, 10th Floor, Chicago, IL

Presentation Highlights

CTA staff delivered a presentation about the proposed Red Line Extension (RLE) Project that would extend the Red Line from the existing 95th Street Terminal to the vicinity of 130th Street. Representatives from the CTA discussed:

- **Project Overview and Benefits**
  The RLE Project would mean a better served Far South Side, by providing direct CTA rail service and reducing commute times from the project area. The project would include four new stations, a new rail yard, and bus and parking facilities at all stations. The project would encourage economic development and benefit the community by bringing construction jobs to the area and increasing access to jobs outside of the project area.

- **RLE Project Alternatives and Potential Impacts**
  CTA is evaluating three options for the Locally Preferred Alternative along the Union Pacific Railroad (UPRR) tracks including an option within the existing freight right-of-way (ROW Option), an East Option, and a West Option. CTA is also evaluating a rail alternative along Halsted Street, a Bus Rapid Transit (BRT) Alternative along Michigan Avenue, and the No Build Alternative.

- **CTA is preparing an Environmental Impact Statement (EIS)**
  CTA has been evaluating the project alternatives and has begun to prepare a Draft EIS which will analyze the potential positive and negative environmental impacts of construction and operation of each alternative and will propose mitigation measures to reduce or eliminated potential negative impacts. Once the CTA completes the Draft EIS, a public hearing will be held to share the findings of the Draft EIS.

- **Parks Impacts**
  CTA has been analyzing the potential impacts of the project from a number of different perspectives, including potential for displacements, noise and vibration, impacts to historic properties and others and understands this meeting is mainly to discuss findings with respect to parks. Based on the analysis, the No-Build, BRT and Halsted Rail Alternative have no associated potential park impacts. All UPRR Alternatives have an impact to Wendell Smith Park due to the overlap with the park and elevated structure/vertical clearances. There would be temporary occupancy of a small portion of the park during construction, but the area underneath the elevated structure would remain open after construction. Depending upon the UPRR alternative selected, the acreage impacted varies.

  In addition to potential temporary impacts to Wendell Smith Park from all UPRR Alternatives, the UPRR East Alternative has potential impact to Block Park. The affected area includes an isolated portion of the park's open space and a communications tower and is in an area of the park that does not currently serve a recreational use. The key recreational features of the park, walking trails and benches, are on the other side of Harvard Avenue in the eastern half of the park. While there would be some temporary construction impacts, no permanent incorporation is needed as the area underneath the elevated track structure would remain open after construction.

  In addition to potential temporary impacts to Wendell Smith Park from all UPRR Alternatives, the UPRR West Alternative has potential permanent impact to Fernwood Parkway. The West Option alignment would run through two of the four parcels that make up Fernwood Parkway between 101st and 103rd Streets and would affect about 1.9 acres of the park. Temporary closure of the section of the park overlapped by the elevated structure would be necessary during construction. Public use of the park could resume after construction, as long as the area underneath the elevated structure is reopened. However, much of the park between 101st and 103rd Streets would be permanently overlapped and shaded by the structure. Concrete aerial supports would be placed permanently in the park space. The West Option would result in a permanent incorporation of the park space and if this option is selected, CTA would work with the Chicago Parks District on appropriate mitigation. Some options have already been discussed with the City, including creating replacement park space nearby and/or adding enhanced recreational features to improve Fernwood Parkway's functionality as a park. The end result would potentially be a net benefit for park users.

Questions and Comments from Meeting Participants

- Discussion ensued about appropriated funds for project development and Sylvia Jones noted that it was her understanding that $1.5 Billion was to be appropriated in 2009 for the Red Line Extension. CTA stated that funding for the EIS planning study had been received and was used to fund this portion of the project. Once the Final EIS is submitted and a Record of Decision is determined by the Federal Transit Administration (FTA), the project would become eligible under the federally competitive New Starts grant funding. Additional local and state funding sources would be needed at that time for further project development.
- Sylvia Jones asked about the future parking fee for the proposed park and ride facility. This has not yet been determined by CTA and would be dependent upon the alternative selected to move forward. As the project develops further, CTA will evaluate the size and scale needed for the park and ride facilities.
- CTA asked about any areas of community concern with regard to the potential for park impacts of proposed alternatives. Discussion ensued about specific parks in the surrounding community. Sylvia Jones asked about impacts to Princeton Park and Trinity Church. Based on review of study area mapping, these facilities are located near 95th Street, east of Eggleston. CTA noted that these areas are outside of the proposed alternatives' alignments and study area. Similarly, CTA was asked whether the study reviewed potential impacts to Kensington Park. CTA noted that this had been reviewed but was outside of the area of potential effect.
- Sylvia Jones noted that Carver Park in Altgeld Gardens is a good example park in the area.
- Cassandra Francis asked that Major Taylor Bike Trail be added to the park impacts mapping, as appropriate. Major Taylor Bike Trail is not impacted by the project, but should be shown for reference purposes.
- Discussion ensued about potential impacts from all UPRR alternatives on Wendell Smith Park. It is understood that this is not a permanent incorporation and that only a small portion of parkland is affected. However, Ms. Francis noted that leaving the area of overlap between the park and elevated structure afterwards does change the nature of the park use.
- Cassandra Francis had concerns about impacts to parks from the UP Rail alternatives and noted that replacement of parks should be considered as part of the mitigation efforts for Block Park as well as Fernwood Parkway. CTA explained that the portion of Block Park that would be impacted is not used for recreational activity currently and does not contain any amenities. If the UPRR West Option is selected, and Fernwood Parkway is impacted, CTA would work with the Chicago Parks Department on appropriate mitigation, including creating replacement park area nearby and other amenities.
- Ms. Francis noted that she would like to work with Erika Sellke at the Chicago Parks Department to conduct a field visit of the potentially impacted parks and determine ways to enhance compact, integrated park areas within the project study area.

Follow Up

CTA Government and Community Relations staff will provide Ms. Jones with a copy of the Section 106 (Historic) Effects Report.

Friends of the Parks and Chicago Parks Department staff will further coordinate a field visit to discuss the potential impacts on parks and appropriate mitigation. CTA offered to coordinate and be part of these field visits if desired.

Friends of the Parks will look for other properties in the area that could be used for parkland mitigation.

MEETING NOTES

RE: **Chicago Park District Coordination Meeting**
Chicago Transit Authority Red Line Extension Project

DATE: **April 8, 2015, 9:00 a.m.**

LOCATION: **Chicago Park District, 541 N. Fairbanks Court, Chicago, IL**

ATTENDEES:

Name	***Initials***	***Organization***
Sonali Tandon	ST	CTA
Jenifer Palmer	JP	CWC Transit Group
Michael Lange	MH	CPD
Doreen O'Donnell	DO	CPD
Rob Rejman	RR	CPD

PREPARED BY: **Jenifer Palmer**

ISSUE DATE: **April 15, 2015**

MEETING NOTES:

- Sonali Tandon (CTA) provided an update on the status of the Red Line Extension Project. Since CTA last met with the Chicago Park District (CPD), there have been some new developments. CTA is preparing a Draft Environmental Impact Statement (EIS) and has narrowed the number of alternatives under consideration to two options of the Union Pacific Railroad Rail Alternative—the East Option and the West Option.

- After the Draft EIS phase, only one option will move forward for further study in the Final EIS. This is a community-driven project and public feedback on the environmental impacts of each option will help in refining the alignment and in selection of a single preferred option.

- There are a number of environmental resource areas studied in the Draft EIS in addition to parks, such as property displacements and noise and vibration, which could have an effect on community decision-making. CTA's goal, therefore, is to work with CPD on further detailing appropriate mitigation measures for each of these options that will result in a no adverse effect to parks following implementation of measures and which allows the public an opportunity to review the park impacts of the two options after mitigation.

- CPD stated that they would provide further information on appropriate mitigation measures for each option that are responsive to community needs and would allow the public to weigh in on the park impacts and mitigation measures in line with other considerations on a preferred option.

- CTA shared maps and information on impacts for each option. The alignment has been refined to reduce park impacts and CTA is continuing to coordinate with Illinois Department of Transportation to seek concurrence on refinements in the I-57 segment. For the East Option, park impacts include a portion of Wendell Smith Park and a portion of Block Park. The West Option would impact Fernwood Parkway – a fewer number of parks but greater acreage affected. CPD noted that mitigation measures should note acre-for-acre replacement in either option.

- CTA shared potential mitigation measures for CPD comment, including replacement park provisions, maintaining park area beneath the structure, restoration/landscaping of any disturbed areas, and incorporating design features into the final transportation infrastructure to enhance parks while maintaining safety of the transit facility. For the West Option, there would also be a potential for creating a bike path beneath the elevated structure. CTA would still need to use the area for maintenance purposes.

- CPD noted that when clipping portions of a park, maintaining the park underneath is not as desirable a mitigation measure from a CPD perspective as replacement. The bike path concept is a very desirable one, especially if it could be a connector to other bike park plans that CPD has (i.e., Calumet). There may also be some interesting opportunities/ideas with regard to both options and providing replacement park space near stations. While a park next to the new station might be a non-continuous park, it would have the potential to enhance the surrounding area and provide better park access and connectivity. When parks are incorporated near transit, they are known to attract greater transit-oriented development.

- CTA shared some additional information on requirements under the National Environmental Policy Act and Section 4(f) as it relates to park impacts. Findings related to Section 4(f) will consider not only the impacts to parks, but the significance of parks and the mitigation measures proposed for the determination of a no adverse effect finding on each option after implementation of mitigation measures.

- Obtaining consensus from CPD, as the official with jurisdiction over findings of the impacts and mitigation measures proposed for each option, will allow the continued community-driven process for selection of a preferred option. A public meeting and comment period on findings of all environmental impacts and mitigation measures proposed is expected to occur in spring 2016.

- As a next step, CTA will send CPD a letter (and the materials reviewed during the meeting) that will outline the major items where CTA would like feedback from CPD.

- CTA shared with CPD next steps in the coordination process. These steps will help formalize mitigation measures and impact findings for both options, which can then be shared with the public for further input and feedback on a preferred option.

CHICAGO TRANSIT AUTHORITY

Mr. Rob Rejman
Director of Planning and Construction
Chicago Park District
541 N. Fairbanks Court
Chicago, IL 60611

Re: CTA Red Line Extension (RLE) Project

Dear Mr. Rejman:

The Chicago Transit Authority (CTA) and Federal Transit Administration (FTA) are continuing efforts to prepare an Environmental Impact Statement (EIS) for the proposed Red Line Extension (RLE) Project in accordance with the National Environmental Policy Act (NEPA).The proposed project would extend the Red Line from the existing 95th Street Terminal to 130th Street, subject to the availability of funding.

CTA recently met with your agency on April 8, 2015 and presented information about the East and West options of the Union Pacific Railroad alignment, potential park impacts, and preliminary mitigation measures for each of the alignment options. In follow up to that meeting, this letter provides additional supporting information on the project, park impacts, and preliminary mitigation measures for further input from your agency. As the official with jurisdiction over these properties, CTA would like additional input from your agency on the following:

1. Confirmation on the attached documentation regarding primary activities and functions that take place at each of the three park properties that would be affected by the options under consideration, including which of these activities and functions constitute the primary purpose of these parks.

2. The views of your agency on the significance of each of these parks in terms of their existing availability and function in meeting the objectives of the Chicago Park District and the surrounding community as well as the impacts and/or benefits of the proposed project with mitigation measures implemented as proposed.

3. Comments and recommendations from your agency on the proposed mitigation measures for impacts and use of each park, including identification of any appropriate replacement park locations for the proposed project mitigation measures.

4. The views of your agency on whether, after implementation of these mitigation measures, the impacts presented would be adverse to the activities, features, or attributes of each park.

We also welcome any other feedback from your agency that would be useful in understanding the views, goals, and objectives of the Chicago Park District in relationship to the proposed RLE Project. Your input will be used and reflected in the Draft EIS and Section 4(f) Evaluation that is being prepared. Section 4(f) of the USDOT Act of 1966 protects significant historic resources as well as publicly owned recreation areas, parks, and wildlife refuges. Once your views on these matters are appropriately incorporated into the document, CTA and FTA will be providing documentation to your agency on the environmental impacts and Section 4(f) findings and will seek concurrence from the Chicago Park District on the determination made. Additional coordination meetings will be scheduled with your agency, as needed, to ensure proper coordination.

At this time, CTA expects to release the Draft EIS and Section 4(f) Evaluation for public review and comment in spring 2016. A public hearing will be scheduled at that time to take public comments on the environmental findings in the Draft EIS and Section 4(f) Evaluation. Based on the technical analysis conducted and public input received, a Final EIS/Record of Decision will be prepared. The Final EIS/Record of Decision will document the results of the Draft EIS process, confirm whether the East or West Option will be constructed, and include a list of committed final mitigation measures for the option chosen. CTA and FTA will continue to work with your agency through this process to keep you informed on the status of this project and to conduct follow up coordination activities, as needed. Additional information about the project is available at: transitchicago.com/RedEIS.

If you have any questions, please do not hesitate to contact me. Thank you for your participation on this project.

Sincerely,

Sonali

Mark Assam, Federal Transit Administration

Project Overview and Description

The Chicago Transit Authority (CTA), as project sponsor to the Federal Transit Administration (FTA), proposes to construct the Red Line Extension (RLE) Project to extend the existing Red Line heavy rail transit service approximately 5 miles south from the existing 95th Street Terminal to 130th Street on Chicago's Far South Side. The project area for the RLE is approximately 11 miles south of the Loop (Chicago's central business district).

The National Environmental Policy Act of 1969 (NEPA) mandates the consideration of environmental impacts before approval of any federally funded project that may have significant impacts on the environment or where impacts have not yet been determined. FTA and CTA are currently preparing a Draft Environmental Impact Statement (EIS) for this project in accordance with NEPA and other applicable regulations, including Section 106 of the National Historic Preservation Act (NHPA), Section 4(f) of the United States Department of Transportation (USDOT) Act of 1966, joint guidance and regulations from FTA and the Federal Highway Administration (FHWA), and other agency regulations and guidelines.

After extensive planning and study, the Chicago Transit Board designated the Union Pacific Railroad (UPRR) Rail Alternative as the Locally Preferred Alternative (LPA) for this project on August 12, 2009. The UPRR Alternative route would run south along I-94 from the 95th Street Terminal, then curve west along the north side of I-57 (within the I-57 right-of-way) for nearly ½ mile until reaching the UPRR corridor in the vicinity of Eggleston Avenue. The alignment would turn south to follow the UPRR corridor.

Two options are being considered for the alignment along the UPRR corridor. The CTA elevated structure would be located either east or west of the existing UPRR corridor. The alignment would follow the UPRR corridor to Prairie Avenue, where it would cross over the Canadian National/Metra Electric District (CN/ME) tracks near 119th Street. South of this point, the East and West Options would follow the same alignment southeast along the NICTD/Chicago South Shore & South Bend Railroad (CSS & SBRR) right-of-way using a portion of the Indiana Harbor Belt Railroad (IHB) right-of-way to the terminus (end) of the RLE at 130th Street.

As described, two UPRR Alternative options for the segment of the proposed route between I-57 and the CN/ME tracks near 119th Street are under further evaluation:

- East Option - The CTA elevated structure would be placed immediately adjacent to the east side of the UPRR right-of-way.

- West Option - The CTA elevated structure would be placed immediately adjacent to the west side of the UPRR right-of-way.

An overview map of the project and alignment options is provided in **Figure 1**.

Park Impact Overview

All public parks within 500 feet of the proposed right-of-way and within ½ mile around the locations of proposed stations were analyzed for potential impacts as a result of implementing the project. **Table 1** summarizes park impacts as a result of each UPRR alignment option. **Figure 2** shows the locations of all parks in the vicinity of the project. The following section provides further details on the park or parks impacted by each alignment option.

UPRR Alternative East Option - Park Impacts

Two park resources would be used as result of the East Option: Wendell Smith Park and Block Park, which are further described below.

Wendell Smith Park

Wendell Smith Park is approximately 4.7 acres (340 feet wide by 610 feet long) and is an actively used facility with basketball courts, baseball fields, a play lot, recreation building, and 0.3 mile of walking trails. Regularly scheduled activities at Wendell Smith Park include basketball tournaments, baseball/softball games, and concerts. The park is also actively used by day camps and for activities organized by the Chicago Park District.

The East Option alignment would run through the northwestern corner of the park, as shown in Error! Reference source not found.. Of the 4.7 acres of the park, approximately 0.7 acre would be overlapped by the elevated structure and its associated clearances. The overlap area includes open space, trees, benches, and a portion of the park's walking trail. The outfield of an existing baseball field would be used. Piers would be located in the park, and the bottom of the elevated structure would be approximately 15 feet above ground level. Because a permanent easement is proposed, the land within the easement would be considered a permanent incorporation (direct use) of the park facilities. Temporary closure of the overlapped portion of Wendell Smith Park would be necessary during construction.

Preliminary Mitigation Measures

Mitigation and enhancement measures are proposed that would result in no adverse effect to the features, attributes, and activities of the park after implementation, as follows:

- Replacement of impacted park space. Payment would be the fair market value of the land and improvements taken or improvements to the remaining site equal to the fair market value of the land and improvements taken. Location of replacement property would be further defined in coordination with the Chicago Park District.
- Relocation or replacement of the baseball field based on further coordination with the Chicago Park District and outreach to the public so that the attributes, features, and activities are not adversely affected by the use of the northwest corner of the park.
- Replacement of facilities affected by the project including sidewalks, paths, benches, lights, trees, and other facilities within the park.
- Restoration and landscaping of disturbed areas.
- Incorporation of design features where necessary to reduce or minimize impacts of use on the Section 4(f) property. Such features would be designed in a manner that would enhance the park but not adversely affect the safety of the transit facility.

Figure 3: Impacts on Wendell Smith Park – -Union Pacific Railroad Alternative East Option

Block Park

Block Park is a passive green space and is divided into two parcels by Harvard Avenue. The east parcel is approximately 1.4 acres (130 feet wide by 460 feet long) and includes amenities such as benches, walking paths, and sidewalks. The west parcel is approximately 1.3 acres (90 feet wide by 600 feet long) and is open space with a sidewalk and no other park amenities. In addition, a radio tower and two utility structures are on the west parcel. Photos of Block Park are shown in **Figures 4** and **5**.

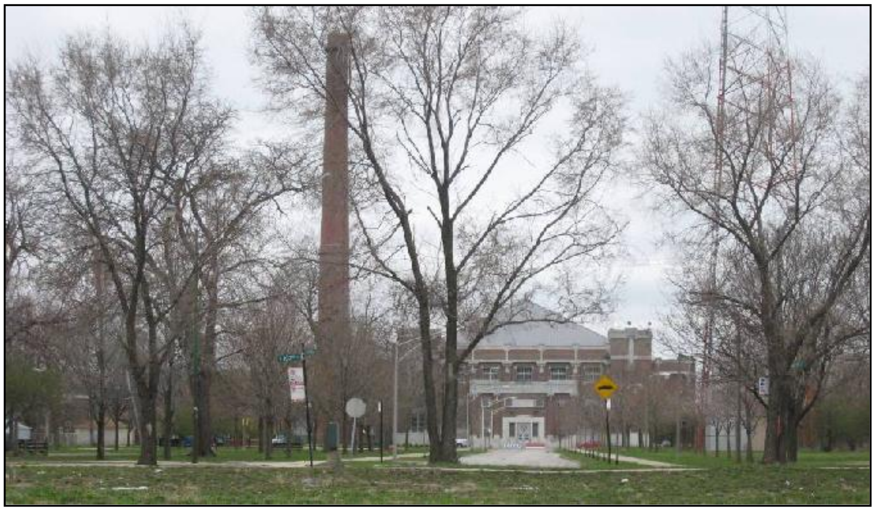

Figure 4: Block Park with the Roseland Pumping Station in the Background (facing south)

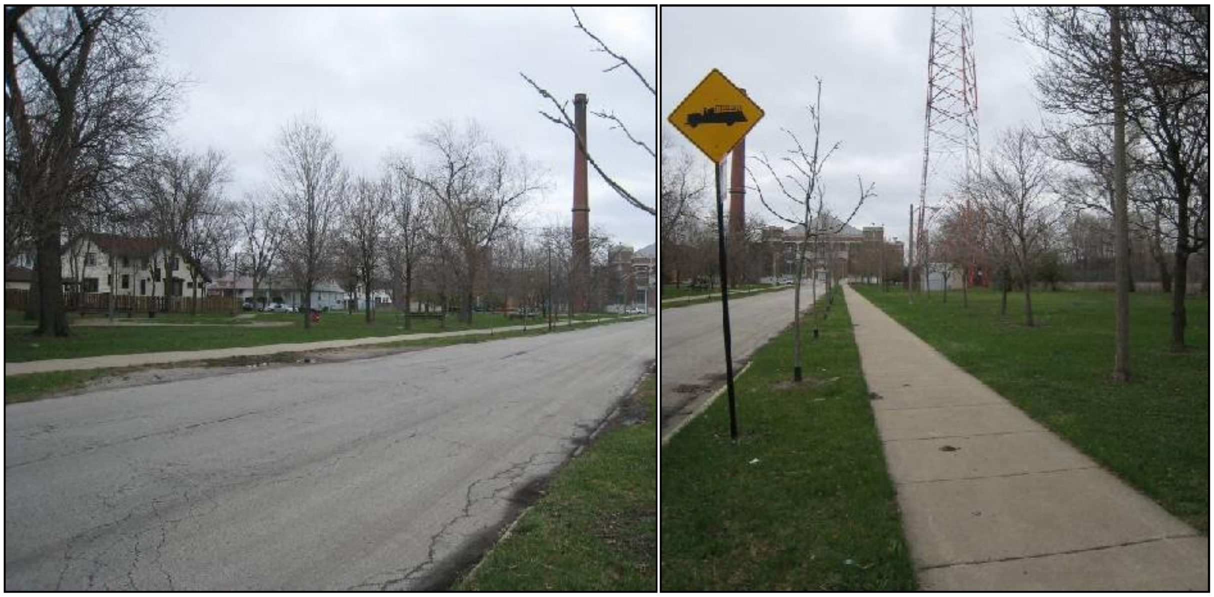

Figure 5: East Parcel (left) and West Parcel (right) of Block Park

The East Option alignment would run through the west parcel of Block Park, and would overlap 0.9 acre of park space with the elevated structure and its associated clearances, as shown in Error! Reference source not found.. A secondary station entrance would also be located in the park, along its western edge. The affected parcel includes an isolated portion of the park's open space and a communications tower, and does not currently serve a recreational use. The key recreational features of the park, walking trails and benches, are on the other side of Harvard Avenue in the east parcel of the park. Because the East Option alignment elevated structure would overlap a portion of this park, there would be a permanent incorporation (direct use) of this passive greenspace. Some temporary closure of the overlapped area would be necessary during construction.

Preliminary Mitigation Measures

Mitigation and enhancement measures are proposed that would result in no adverse effect to the features, attributes, and activities of the park after implementation. CTA and the Chicago Park District are currently coordinating to define any additional or alternative mitigation measures that may be necessary:

- Replacement of impacted park space. Payment would be the fair market value of the land and improvements taken or improvements to the remaining site equal to the fair market value of the land and improvements taken. Location of replacement property would be further defined in coordination with the Chicago Park District. Providing enhanced park connectivity to the proposed station area at 103rd Street and other CPD park projects in the nearby area could be considered to enhance the attributes, features and activities of this existing passive green space.

- Restoration and landscaping of disturbed areas.

- Incorporation of design features where necessary to reduce or minimize impacts of use on the Section 4(f) property. Such features would be designed in a manner that would enhance the park but not adversely affect the safety of the transit facility.

map id: 12_05

Figure 6: Impacts on Block Park - East Option

UPRR Alternative West Option - Park Impacts

One park resource would be used as result of the West Option—Fernwood Parkway—which is further described below.

Fernwood Parkway

Fernwood Parkway is a passive green space, and is divided into two parcels separated by 101st Street. The northern parcel, from 99th Street to 101st Street, is approximately 2.4 acres (78 feet wide by 1,325 feet long). The southern parcel, from 101st Street to 103rd Street, is approximately 2.9 acres (78 feet wide by 1,277 feet long). Both the north and south parcels of Fernwood Parkway serve as open space and do not contain recreational facilities or amenities such as sidewalks or benches. Some trees are planted within the park and a chain-link fence separates the green space from the existing at-grade UPRR tracks. **Figures 7 and 8** shows Fernwood Parkway facing north and south.

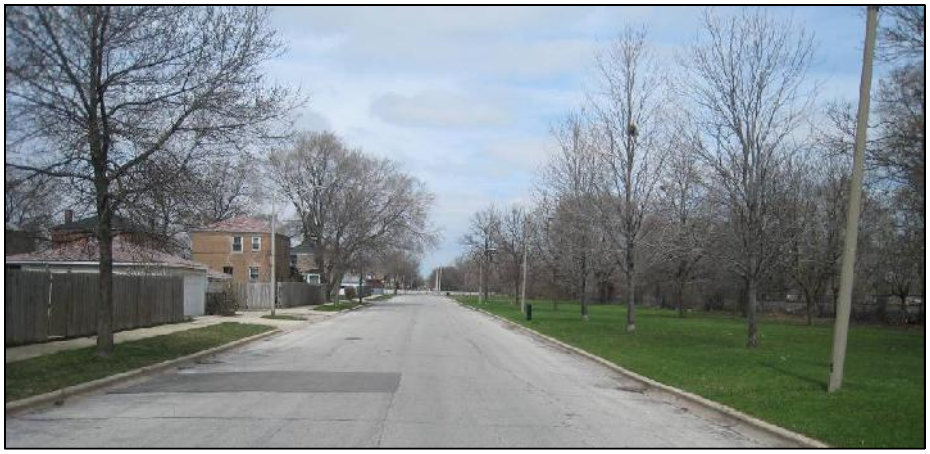

Figure 7: Fernwood Parkway at 100th Street and Eggleston Avenue (facing north)

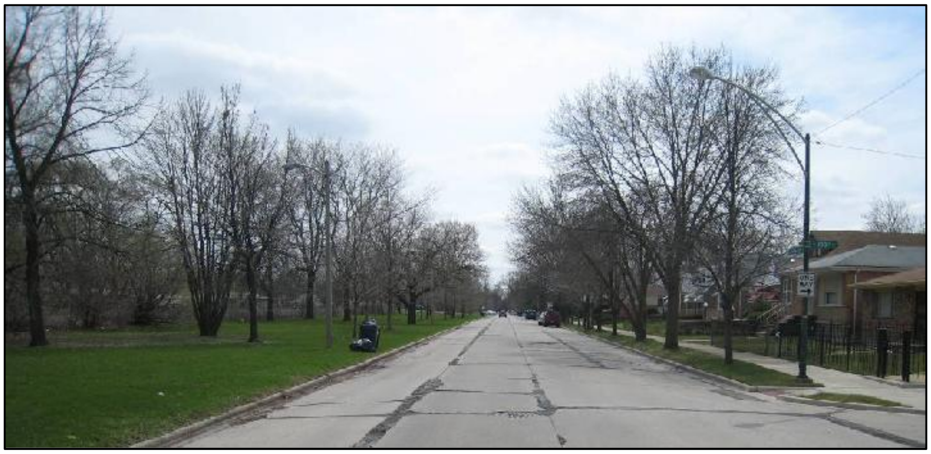

Figure 8: Fernwood Parkway at 100th Street and Eggleston Avenue (facing south)

The West Option track structure would run through two of the four parcels that make up Fernwood Parkway between 101st and 103rd Streets. Approximately 1.9 acres of the parkway would be overlapped by the elevated structure and its associated clearances (see Error! Reference source not found.). The parkway functions as open space, and does not contain recreational amenities. Temporary closure of the section of the overlapped section of the parkway would be necessary during construction. Public use of the parkway could resume after construction, as long as the area beneath the elevated track structure is reopened, but much of the parkway between 101st and 103rd Streets would be permanently overlapped and shaded by the structure. Elevated track structure supports would be placed permanently in the park space. Because the West Option alignment elevated structure would overlap a portion of this park, there would be a permanent incorporation (direct use) of this passive green space.

Preliminary Mitigation Measures

Mitigation and enhancement measures are proposed that would result in no adverse effect to the features, attributes, and activities of the park after implementation, as follows:

- Replacement of impacted park space. Payment would be the fair market value of the land and improvements taken or improvements to the remaining site equal to the fair market value of the land and improvements taken. Location of replacement property would be further defined in coordination with the Chicago Park District.
- Potential installation of a new bicycle path beneath the elevated track structure, subject to use for CTA maintenance, which would enhance the existing unused green space and better connect parks and the newly proposed transit infrastructure.
- Restoration and landscaping of disturbed areas.
- Incorporation of design features where necessary to reduce or minimize impacts of use on the Section 4(f) property. Such features would be designed in a manner that would enhance the green space but not adversely affect the safety of the transit facility.

Re: CTA Red Line Extension (RLE) Project

Dear Ms. Tandon:

The Chicago Park District (CPD) appreciates the opportunity to review the draft of the proposed park impacts for the CTA Red Line Extension (RLE) Project dated June 8, 2015. Any proposed mitigation measures should include fully developed replacement property with the appropriate replacement improvements in the community area. The CPD's priorities for replacement park sites is to expand existing parks.

CPD's neighborhood parks range in size from 2-5 acres in size. These are parks that contain indoor and/or outdoor recreation facilities and typically include a playground and/or other sport fields. The standard for new parks is a minimum of two (2) acres in size. If Recognized Environmental Conditions are identified in the Phase 1 Environmental Site Assessment (ESA) then a Phase 2 ESA is required. If there are exceedances of the Illinois Environmental Protection Agency's (IEPA) TACO Tier 1 Residential Standards, then the property is required to receive a Comprehensive No Further Remediation (NFR) Letter from the IEPA's Site Remediation Program.

The documentation regarding primary activities and functions that occur in each of the three parks is accurate. CPD concurs conceptually with the proposed mitigation measures as outlined in the coordination package.

Wendell Smith (#272) Park is a 4.7-acre neighborhood park that primary serves the population within a ½ mile. Improvements include two basketball courts, two baseball fields, a playground, recreation building and .3 miles of walking trails. In addition to the areas described in the letter, the overlap area includes space behind the existing baseball backstop. Preliminary mitigation measures should include replacement property located in the Roseland Community area constructed in accordance with Chicago Park District standards.

Block (#1005) Park is a 2.95-acre passive park that provides informal active recreational uses or other accessory uses. The east option alignment affects the entire function of the 1.3 acre west parcel, including the accessory communication tower space. Preliminary mitigation measures should include replacement property located in the Roseland Community area constructed in accordance with Chicago Park District standards. Additionally, mitigation and replacement of the communications and utility structures is required.

Fernwood (#1215) Parkway is an 8.63-acre linear passive park that provides informal active recreational uses or other accessory uses. The parkway functions as open space and provides a quiet natural setting for park users. The Chicago Park District would not program or maintain areas beneath the elevated track structures. Preliminary mitigation measures should include replacement property located in the Washington Heights Community area constructed in accordance with Chicago Park District standards.

The suggested mitigations strategies coupled with the above comments should address all the adverse impacts on the Parks. We look forward to a successful collaboration.

Sincerely,

Rob Rejman
Director of Planning and Construction

RR/ml

RED AHEAD Red Line Extension

Red Line Extension

Connecting 95th Street Terminal to 130th Street

The Chicago Transit Authority (CTA) is proposing to extend the Red Line from the existing 95th Street Terminal to 130th Street, subject to the availability of funding. The proposed 5.3-mile extension would include four new stations near 103rd Street, 111th Street, Michigan Avenue, and 130th Street. Each new station would include bus and parking facilities. This project is one part of the Red Ahead Program to extend and enhance the entire Red Line.

Learn more about this project.

What's New?

In August 2014, we announced that list of extension alternatives have been narrowed to one "preferred alternative" with two variations:

- **Union Pacific Railroad Rail (UPRR) Alternative, East Option**
  Under this option, the CTA elevated structure would be placed immediately east of the Union Pacific Railroad right-of-way from 99th Street to 118th Street.
- **Union Pacific Railroad Rail (UPRR) Alternative, West Option**
  Under this option, CTA elevated structure would be placed immediately west of Union Pacific Railroad right-of-way from 99th Street to north of 118th Street.

The proposed alignment of the rapid transit line would be the same for the two East and West options from 95th Street to 99th Street and from 118th Street to 130th Street.

The CTA arrived at these options based on environmental analysis and comments received at the public open house meeting in May 2014 as well as additional public comments submitted in summer 2014.

In addition to the selection of the "preferred alternative", the CTA has also announced $5 million of bond funds to move forward on the required federal planning process for the rail line extension.

RED AHEAD Red Line Extension

About the Red Line Extension

Connecting 95th Street Station to 130th Street

Overview

The Chicago Transit Authority (CTA) is proposing to make transportation improvements by extending the Red Line from the 95th Street Terminal to the vicinity of 130th Street. This project is one part of the Red Ahead Program to extend and enhance the entire Red Line.

Purpose & Need

The purpose of the Red Line Extension is to:

- Reduce commute times for residents both within and south of the project area.
- Improve mobility and accessibility for transit-dependent residents in the project area.
- Improve rapid transit rail service to isolated areas and provide viable linkages between affordable housing (e.g., Altgeld Gardens public housing project), jobs, services, and educational opportunities, thereby enhancing livability and neighborhood vitality.
- Provide an opportunity for potential connections and linkages to other public transportation modes including regional commuter rail in the project area.
- Foster economic development in the project area, where new stations may serve as catalysts for neighborhood revitalization and help reverse decades of disinvestment in local business districts.

The RLE Project is needed to respond to the following problems:

- Transit trips to jobs are longer for Far South Side residents than they are for passengers in the Chicago seven-county region as a whole.
- Transit-dependent populations in the project area have limited direct access to rapid transit rail service.
- The project area is geographically isolated from major activity centers and provides residents limited viable transportation options, which limit access between affordable housing and employment centers outside of the project area.
- Existing transit markets are underserved and transit connectivity is challenging in the project area.

- Disinvestment and limited economic development in the project area have negatively impacted Far South Side communities.

Project Alternatives

CTA began developing the alternatives that are being studied in Draft EIS during the Alternatives Analysis (AA) which took place from 2006 to 2009. Starting with multiple modes and corridor options, CTA developed and screened alternatives through a combination of conceptual engineering, public input (open houses and stakeholder meetings), and preliminary analysis of potential impacts and costs.
In preparation for the Draft Environmental Impact Statement (EIS), CTA evaluated the following alternatives and options:

- No Build Alternative
- Bus Rapid Transit Alternative
- Union Pacific Railroad Rail (UPRR) Alternative
  - Right-of-Way Option
  - East Option
  - West Option
- Halsted Rail Alternative

In August 2014, based on the technical analysis and public input CTA announced narrowing down the number of alternatives to a single Preferred Alternative with two options—the UPRR Rail Alternative. The Draft EIS will summarize the environmental benefits and impacts of the No Build Alternative and two UPRR Rail Alternative options: the East Option and the West Option.

No Build Alternative

The No Build Alternative is defined as the existing transportation system plus any committed transportation improvements that are already in the Chicago Metropolitan Agency for Planning (CMAP) Fiscal Year 2010-2015 Transportation Improvement Program (TIP). All elements of the No Build Alternative are included in each of the other alternatives.

The No Build Alternative would include the following:

- Existing transportation system
- Committed transportation improvements including bridge reconstructions, 95th Street Terminal Improvement Project, several road improvement projects including resurfacing and coordination of signal timing, work on Metra's facilities, construction of a bicycle/pedestrian multi-use trail, and preservation of historic facilities
- Bus transit service focused on the preservation of existing services and projects

Union Pacific Railroad (UPRR) Rail Alternative – Locally Preferred Alternative ✓

The proposed UPRR Rail Alternative would extend the heavy rail transit line from the existing Red Line 95th Street Terminal to 130th Street. The UPRR Rail Alternative would operate on an elevated structure heading south from 95th Street along the I-57 Expressway for nearly one-half mile until reaching the UPRR corridor in the vicinity of Eggleston Avenue. The alignment would then turn south along the UPRR corridor to approximately 111th Street where it would turn southeast. East of South Prairie Avenue, the alignment would cross over the Canadian National/Metra Electric tracks near 119th Street, where it would transition to an at-grade profile and then continue southeast along the Northern Indiana Commuter Transportation District Chicago South Shore & South Ben Railroad (NICTD/CSS & SBRR) right-of-way using a portion of the Indiana Harbor Belt (IHB) alignment to terminate at 130th Street. The Chicago Transit Board selected the UPRR Alternative as the Locally Preferred Alternative on August 12, 2009.

The Locally Preferred Alternative would include the following features:

- Transportation improvements that are already in the Chicago

Metropolitan Agency for Planning Fiscal Year 2010-2015 Transportation Improvement Program as described in the No Build Alternative

- 5.3-mile heavy rail transit line extension from 95th Street Terminal to 130th Street
- Four new stations at 103rd Street, 111th Street, Michigan Avenue, and 130th Street
- New park & ride and bus terminal facilities at each station
- Bus transit service from the south to the new stations for faster travel to downtown Chicago
- New yard and shop at 120th Street

Two alignment options are being studied in the Draft EIS:

- **East Option**
  Under this option, the CTA elevated structure would be placed immediately east of the Union Pacific Railroad right-of-way from 99th Street to 118th Street.
- **West Option**
  Under this option, CTA elevated structure would be placed immediately west of Union Pacific Railroad right-of-way from 99th Street to north of 118th Street.

The proposed alignment of the rapid transit line would be the same for the two East and West options from 95th Street to 99th Street and from 118th Street to 130th Street.

RED AHEAD Red Line Extension

Environmental Review

Overview

The National Environmental Policy Act (NEPA) requires evaluation of potential environmental impacts associated with federal projects and actions. In accordance with the NEPA, the Chicago Transit Authority (CTA) and the Federal Transit Administration (FTA) are preparing an Environmental Impact Statement (EIS) that will evaluate the environmental effects of constructing and operating the proposed extension.

Environmental Impact Statement

The CTA is currently in the process of preparing a Draft EIS. The Draft EIS will include an evaluation of the No Build Alternative, the BRT Alternative, the UPRR Rail Alternative, and the Halsted Rail Alternative. The Draft EIS will describe the alternatives, the existing environmental setting, the potential impacts from construction and operation of the alternatives, and proposed mitigation measures to reduce or eliminate potential impacts.

The purpose of the EIS is to study, in a public setting, the effects of the proposed project and its alternatives on the quality of the physical, human and natural environment. Areas to be evaluated for potential impacts from construction and operation of the proposed project include, but are not limited to:

- Transportation
- Land use and economic development
- Displacement and relocation of existing uses
- Neighborhoods and communities
- Visual and aesthetic
- Noise and vibration
- Safety and security
- Historic and cultural resources
- Hazardous materials
- Air quality
- Wetlands
- Water quality
- Floodplains
- Vegetation and wildlife habitat
- Threatened and endangered species
- Geology and soils
- Energy
- Environmental Justice

The evaluation will reveal the extent to which the proposed project will or will not affect these areas. Measures to avoid, minimize, and mitigate potential adverse impacts will also be identified and evaluated.

CTA began public outreach on the project as part of the Alternatives Analysis from 2006 to 2009. Outreach continued during the formal Environmental Impact Statement (EIS) scoping period in 2009, and has continued through the preparation of Draft EIS starting in 2012. CTA will continue to involve and consult with the community as the project proceeds through the environmental process.

Open House - 2014

CTA conducted outreach in April and May of 2014 to update the public on the status of the project; inform them of proposed alternatives, anticipated project benefits, and impacts; and gather feedback. Outreach included meetings with elected officials, interested community groups, and a public open house. The open house was held May 13, 2014 at the Palmer Park Gymnasium, 201 E. 111th Street in Chicago from 5:30 PM to 7:30 PM.

Newsletter - 2013

CTA sent a newsletter with a general project update to the approximately 3,200 addresses on the stakeholder database on August 27, 2013.

August 2013 Newsletter

Open House - 2011

CTA held an open house meeting on August 2, 2011 to update the community regarding the RLE Project. The meeting was held at St. John Missionary Baptist Church, 211 E. 115th Street in Chicago from 6:00 PM to 8:30 PM.

August 2011 Open House Exhibit Boards

Scoping and Scoping Meetings - 2009

The process of determining the scope, focus, and content of an EIS is known as "scoping." Scoping meetings are an opportunity to obtain information from the public and governmental agencies. The scoping process asks agencies and interested parties to provide input on the proposed alternatives, the purpose and need for the project, the proposed topics of evaluation, and potential effects and mitigation measures to be considered.

The official public comment period for scoping concluded on October 27, 2009. The comments received are summarized in the Scoping Report. Input received during scoping is used to refine the project purpose and need and alternatives, and to direct the analysis of environmental impacts. Public input is also used to help planners avoid potential impacts, and to identify potential mitigation measures.

Alternatives Analysis - 2006–2009

The purpose of the Alternatives Analysis (AA) Study, which ended in August 2009, was to examine a wide range of potential transportation options. In the AA process, the project's purpose and need were identified, alternatives that meet the purpose and need were developed and evaluated, and comprehensive and ongoing public involvement was initiated. Many different transportation alternatives were identified in the AA process. Based on public comment and an evaluation of those options against criteria that included cost, environmental factors, and feasibility considerations, the number of options was narrowed. There were three screening stages and the results of each screening stage were presented at public meetings. At each stage, there was an opportunity for the public to review and comment on the results. The end result of the AA process was the selection of a Locally Preferred Alternative by the Chicago Transit Board on August 12, 2009.

Screen 1 Analysis

The CTA held public open houses to receive input on preliminary findings from Screen 1 of the Alternatives Analysis Study for the proposed Red Line Extension.

Tuesday, April 10, 2007, 6-8 p.m.
Chicago State University, New Academic Library, 4th Floor Auditorium
9501 S. King Drive, Chicago, IL 60628

Wednesday, April 11, 2007, 6-8 p.m.
West Pullman Branch, Chicago Public Library
830 W. 119th St., Chicago, IL 60628

Presentations delivered at the Screen 1 meetings are available at the links below:

Public Meeting Presentation Part 1 - April 2007 (3 MB PDF)
Public Meeting Presentation Part 2 - April 2007 (2 MB PDF)
Public Meeting Presentation - April 2007 (Text version)

Public Meeting Display Boards - April 2007 (3 MB PDF)
Public Meeting Display Boards - April 2007 (Text version)

Public Meeting Comment Card - April 2007 (0.4 MB PDF)

The official public comment period for the study's Screen 1 preliminary findings meeting concluded on May 11, 2007. Full documentation of all comments and questions as well as complete responses are provided in the following files:

Screen 1 Public Comment Database (0.1 MB PDF)
Screen 1 Responses to Public Comments (0.1 MB PDF)

Screen 2 Analysis

The CTA held public open houses to present possible transit technologies and alignments in a study area bordered by 95th Street on the north, Ashland Avenue on the west, Stony Island Avenue on the east, and the Cal-Sag Channel/Little Calumet River and 134th Street on the south.

Wednesday, December 3, 2008, 6-8 p.m.
Historic Pullman Visitor Center
11141 South Cottage Grove, Chicago, IL 60628

Thursday, December 4, 2008, 6-8 p.m.

RED AHEAD

Red Line Extension

Red Line Extension Project: FAQ

The Chicago Transit Authority (CTA) knows residents and potential Red Line riders have questions about this proposed extension.

Q: How would CTA fund this proposed project?
A: Two types of funding are needed for the proposed extension – capital and operating. Capital funding (construction funding) for the proposed extension is provided partially by the Federal Transit Administration (FTA), through its "New Starts" grant program. This program provides funding for major public transit infrastructure projects throughout the United States through a highly competitive process. CTA is currently in the environmental review phase of that process that will allow the agency to apply for funding. Upon successfully advancing through the FTA's process, a project would be qualified to receive a Full Funding Grant Agreement (FFGA) from the Federal Transit Administration. The FFGA typically covers about half of a project's capital cost. Other non-federal funds will comprise the remainder of capital funding. Once the proposed extension is built and operational, CTA's operating budget would support day-to-day service.

Q: When would the extended Red Line be open for use?
A: No timeline has yet been established. Project schedule is dependent on federal reviews and approvals and funding availability.

Q: When would construction begin on the proposed Red Line Extension?
A: No timeline has yet been established. Project schedule is dependent on federal reviews and approvals and funding availability.

Q: What will be the operating hours for the proposed extension?
A: In the current project planning phase, the operating hours for the proposed extension are assumed to be the same as for the current Red Line, which operates 24 hours every day of the year.

Q: Would CTA need to buy private property because of the location of the proposed extension?
A: Yes, CTA would need to buy private property for the selected option. The number of properties affected varies; between approximately 215 and 279 properties could be affected. Final property acquisition requirements would be confirmed as project engineering proceeds. Property owners will be paid not less than fair market value for their land and buildings, and may be eligible for compensation equal to the original purchase price of the property. They will also be assisted in relocating their businesses or dwellings, per the Federal Uniform Act on relocation assistance and property acquisition. When

a single option is chosen, CTA will work with the community and property owners (including the UPRR) to minimize property impacts.

Q: Will there be places to park near the new stations?
A: New park & ride lots are proposed at each new station.

Q: How would this proposed extension impact the natural environment and the community?
A: Potential impacts to the environment are being studied in the Draft Environmental Impact Statement (EIS). The Draft EIS will:
• Identify and evaluate measures to avoid, minimize and mitigate adverse impacts.
• Describe the potential environmental effects of the proposed Red Line Extension improvements and the steps that will be taken to alleviate them.
Typically, environmental reviews for proposed transit projects address:

- Transportation
- Land use and economic development
- Displacement and relocation of existing uses
- Neighborhoods and communities
- Visual and aesthetic
- Noise and vibration
- Safety and security
- Historic and cultural resources
- Hazardous materials
- Air quality
- Wetlands
- Water quality
- Floodplains
- Vegetation and wildlife habitat
- Threatened and endangered species
- Geology and soils
- Energy
- Environmental Justice

Q: How would this proposed extension impact noise in the community?
A: The Draft Environmental Impact Statement (EIS) will evaluate the potential for noise impacts to the surrounding community. If it is determined that there could be noise impacts, then mitigation measures to reduce those impacts would be proposed in the Draft EIS such as welded rail, closed deck structures, and noise barriers. During the public review of the Draft EIS, you will have an opportunity to review and comment on the analysis and the proposed mitigation measures.

Q: What is the economic impact of this proposed extension?
A: The Draft Environmental Impact Statement (EIS) will evaluate the fiscal and economic benefits and potential impacts of the proposed extension. During the public review of the Draft EIS, you will have an opportunity to review and comment on the economic analysis. Numerous transit studies suggest that transit investments result in economic development. CTA estimates between 2,600 and 4,100 jobs would be created during Red Line Extension construction. In addition, new stations may serve as catalysts for neighborhood revitalization and help reverse decades of disinvestment in local business districts.

Q: How would the proposed Red Line Extension affect current CTA services, both during construction of the new service and during operation of the new service?
A: The specifics of construction for the proposed Red Line Extension have not been established yet. CTA's general guidelines minimize the effects of construction on existing transit services. However, bus reroutes are possible. Once the proposed extension is complete, existing bus routes may be changed to complement the new high-capacity transit service. Depending on the specific route of the service, the number of routes feeding into the 95th Street Terminal may be reduced, which would also reduce congestion in and

around this facility.

Q: Is it possible that at some point this proposed Red Line Extension could go even farther to the Gary Airport and South Bend, Indiana?
A: At this point CTA's proposal for the Red Line Extension is limited to the project's defined study area, which is bounded by the Little Calumet River and 134th Street on the South. Any initiative to further expand service to the Gary Airport and South Bend, Indiana, would merit further investigation and its own planning study.

Q: For the Locally Preferred Alternative near the Union Pacific Railroad (UPRR) tracks, has CTA talked with Union Pacific representatives?
A: CTA has had preliminary conversations with UPRR and will continue to coordinate with the railroad as plans proceed. The UPRR requires that the CTA tracks be located at least 50 feet from the existing freight tracks due to safety considerations.

Q: Can engineering design be done at the same time as the Environmental Impact Statement is being drafted?
A: As part of the new Moving Ahead for Progress in the 21st Century Act (MAP-21) policy, environmental review is completed during the Project Development Phase. The Engineering Phase is the next step, during which engineering and design is completed. The timing for the Engineering Phase is subject to funding availability and federal approvals. Currently, CTA has not secured approval and funding for the Engineering Phase.

Q: How does work on the other Red Ahead projects affect progress on the Red Line Extension?
A: Red Line Extension project is one part of the Red Ahead Program to extend and enhance the entire Red Line. The Red Ahead program consists of separate projects with their own separate sources of potential funding and timelines. These projects are mutually beneficial and are combined into the Red Ahead program to ensure that they are coordinated efficiently.

Q: What portion of the extension would be elevated?
A: The UPRR Rail Alternative would operate on an elevated structure from approximately 95th Street to 118th Street, where it would transition to an at-grade profile and then continue at grade before terminating near 130th Street. The terminal station would be at-grade, whereas other stations would be elevated.

Q: Would this extension connect to existing Metra Electric or South Shore services?
A: There is potential for connection of the proposed Red Line Extension to the Northern Indiana Commuter Transportation District (NICTD) South Shore Commuter Rail Line in the vicinity of 130th Street, where the two lines would be adjacent to each other. This potential connection will be explored in further detail during the engineering phase. A connection between the Red Line Extension and Metra Electric District at Kensington/115th Street station is not possible, as the proposed Red Line Extension routing crosses the Metra Electric District Line approximately one-half mile to the south of the Kensington/115th Street station.

Q: Is CTA coordinating with Metra on the Red Line Extension?
A: CTA is coordinating with Metra on our progress with the Red Line Extension project. Metra is a participating agency in the environmental review process for the Red Line Extension.

Federal Transit Administration’s
New Starts Process

Red Line Extension Alternatives Analysis Study

4-5-2007

Schedule for Tonight’s Meeting

- **Structure of the Meeting**
- **Questions and Answers Process**
  - Submit your comments in writing on comment cards
  - Comments and questions will be grouped and answered by topic
  - All comments and questions will be addressed on CTA’s website **-** www.transitchicago.com
  - An interpreter for the hearing impaired and a translator for the Spanish speaking community are available this evening

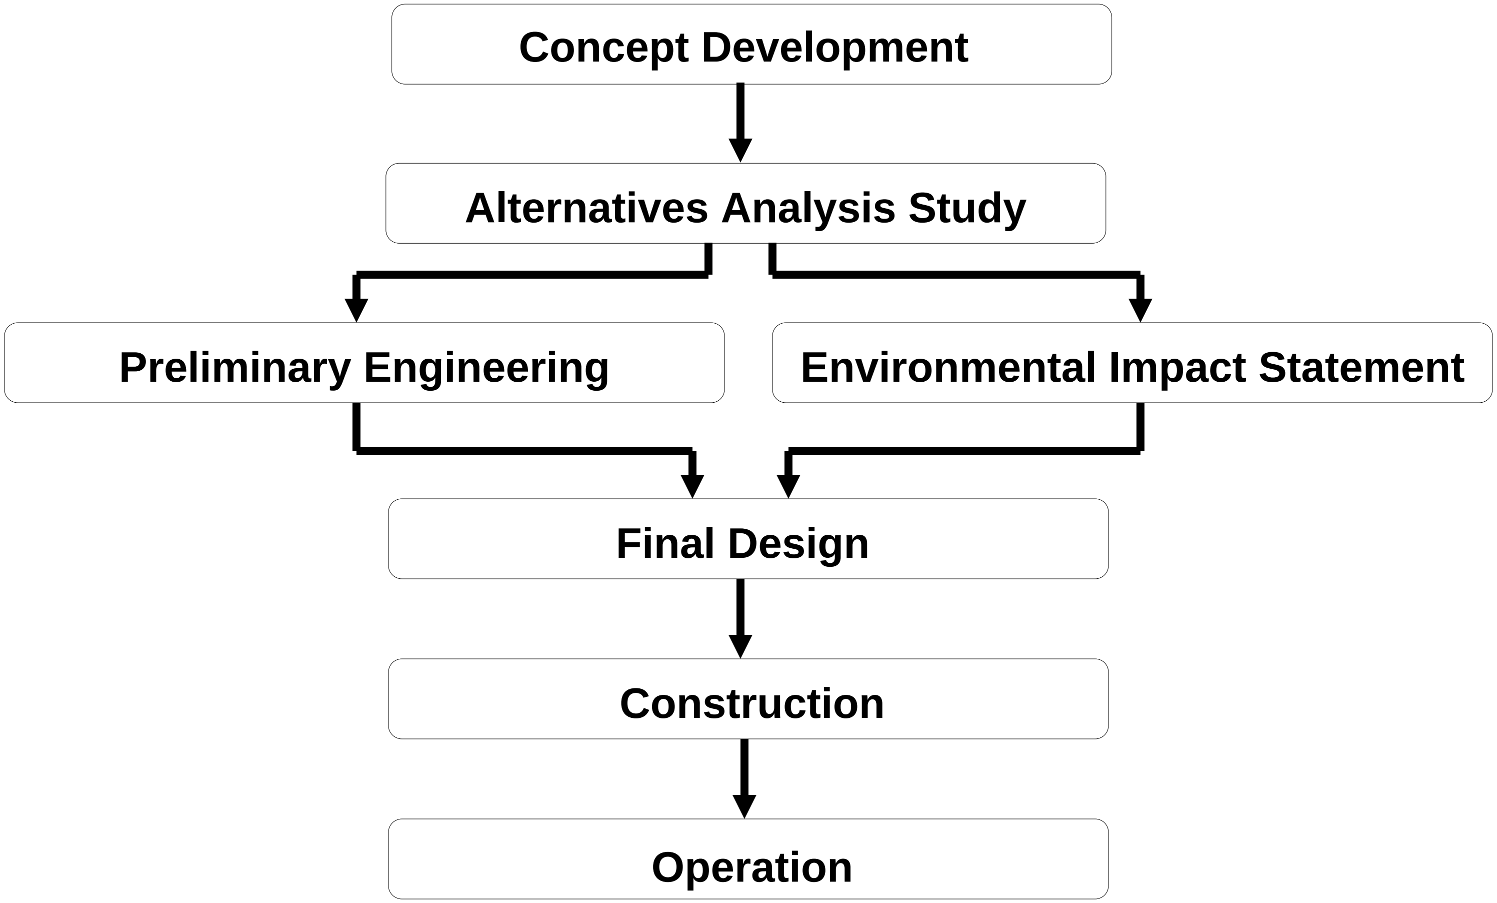
Tonight's Speakers

- **Darud Akbar – Moderator**
  - Chicago Transit Authority
- **Jeffrey Sriver – Project Manager**
  - Chicago Transit Authority
- **Ronald Shimizu – Red Line Study Area Manager**
  - PB Americas, Inc.

Outline of the Presentation

- Describe Federal Transit Administration's (FTA) Required "New Starts" Process
- Define Alternatives Analysis Study Steps
- Emphasize Importance of Public Involvement Process
- Discuss Status of Red Line Extension Alternatives Analysis Study

FTA’s Required New Starts Process



Concept Development

Alternatives Analysis Study

Preliminary Engineering

Environmental Impact Statement

Final Design

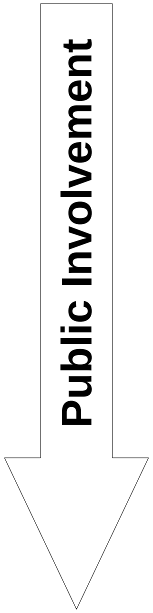
Construction

Operation

Alternatives Analysis (AA) Studies

- FTA Requirement for Federal Funding for Transit Expansion (New Starts)
- Identifies Transit Opportunities and Ensures All Practical Solutions are Considered
- Ensures Planning is Consistent Among All New Starts Projects Throughout the Country
- Provides Opportunity to Gather Information and Receive Public Input
- Identifies Locally Preferred Alternative

Alternatives Analysis Process – Key Steps



Public Involvement

- Define Purpose and Need
- Identify all Possible Transportation Alternatives called the “Universe of Alternatives”
- Evaluate Viability of Possible Alternatives through a Screening Procedure
- Identify Locally Preferred Alternative

Public Involvement Process

- **Key Component of the Alternatives Analysis Study**
- **Opportunity to Provide Information and Receive Public Input**
  - Your comments are needed to complete this screening process
- **Community Outreach:**
  - General public, elected officials, community and civic organizations, faith-based organizations, city and state agencies
- **Ongoing Public Involvement/Input**
  - Meetings announced through public notices and advertisements
  - Project updates on the CTA web site - www.transitchicago.com, accessible at local public libraries

Status of Study

Screen 1

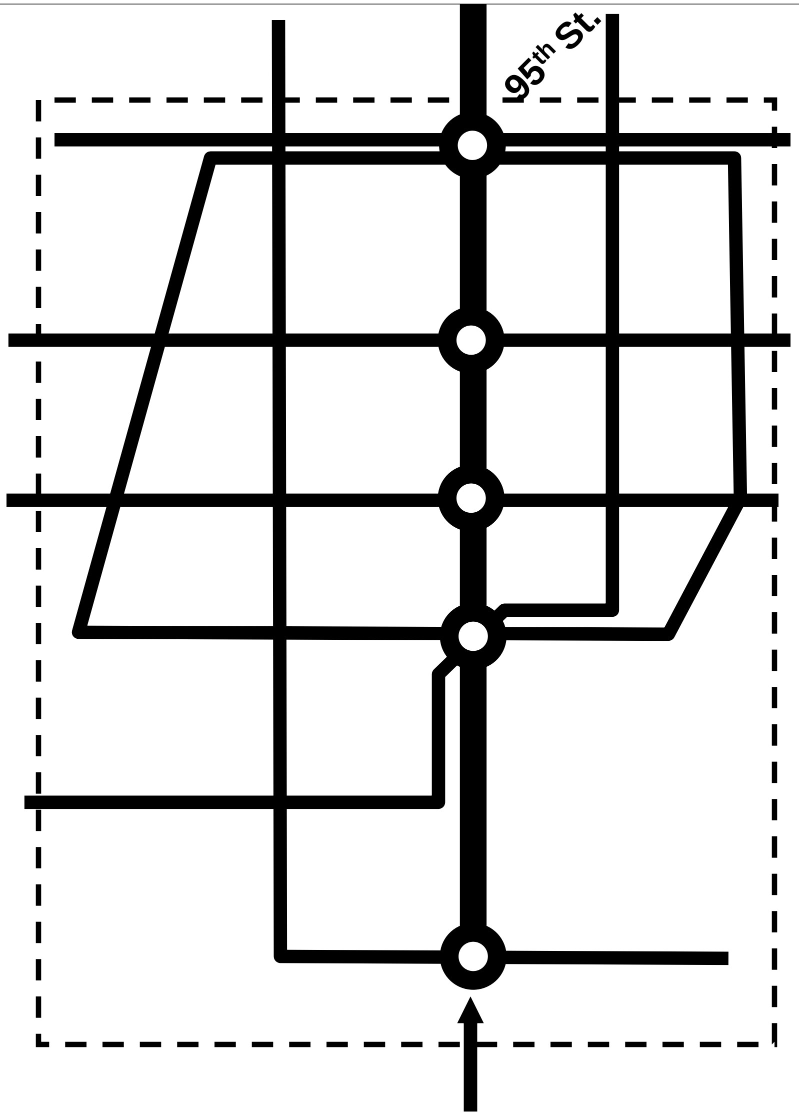
Purpose and Need

- Significant Bus and Passenger Congestion at 95th Street Red Line Station
- Lengthy Bus Trips to Access 95th Street Red Line Station
- Far South Area Residents Experience 20% Longer Commute Times than Rest of City
- Traffic Congestion is Expected to Grow along with Study Area Population and Employment

Screen 1

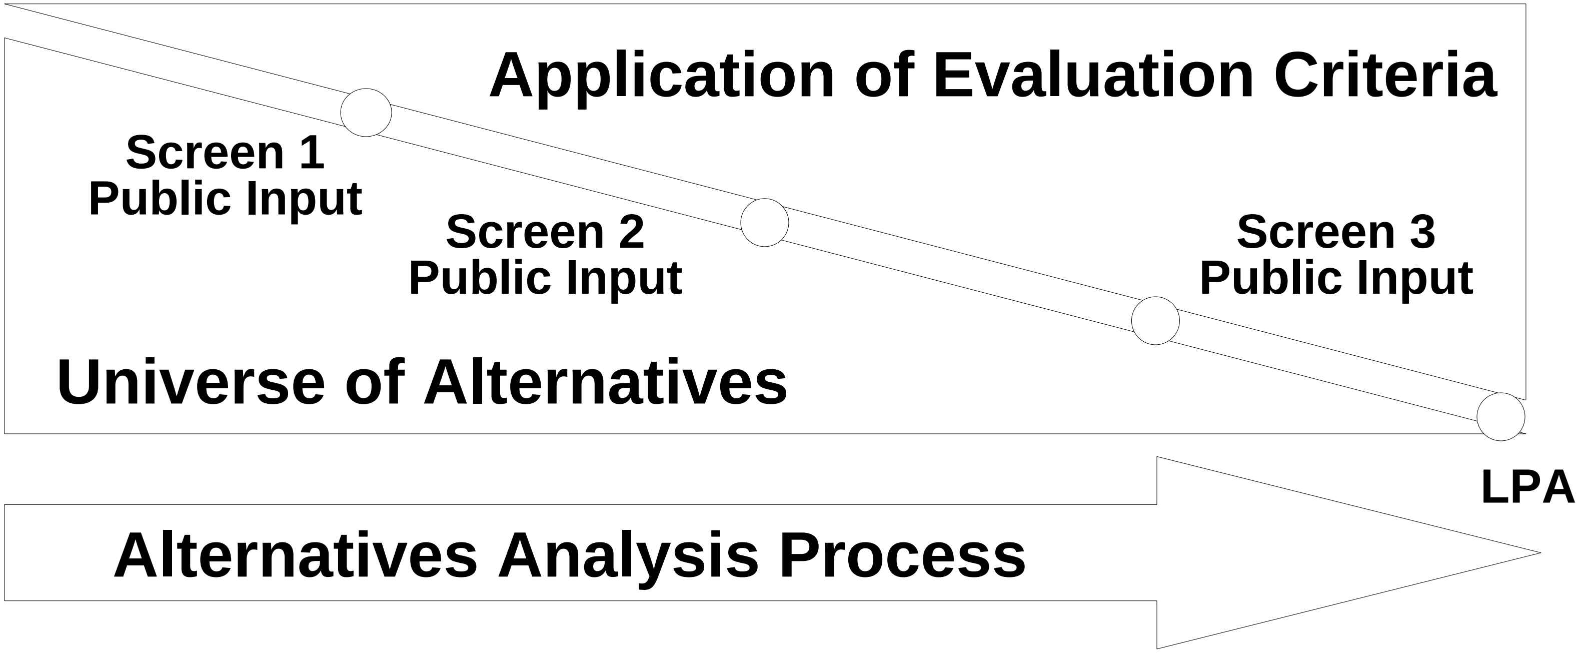
Opportunity for Improvement

- **Extend Rapid Transit Service South From 95th Street Red Line Terminal:**
  - **Improve access to, within, and beyond study area**
  - **Shorten transit travel times through faster and more direct routings**
  - **Stimulate economic development and job opportunities**



FTA Evaluation Process

As the AA study progresses and the evaluation criteria are applied, options within the Universe of Alternatives are eliminated until, at the end of the process, there is a Locally Preferred Alternative (LPA).



Application of Evaluation Criteria
